IDEA: NASA-EPA-NOAA partnership to improve air quality assessment, management, and prediction by infusing (NASA) satellite measurements into (EPA, NOAA) analyses for public benefit.

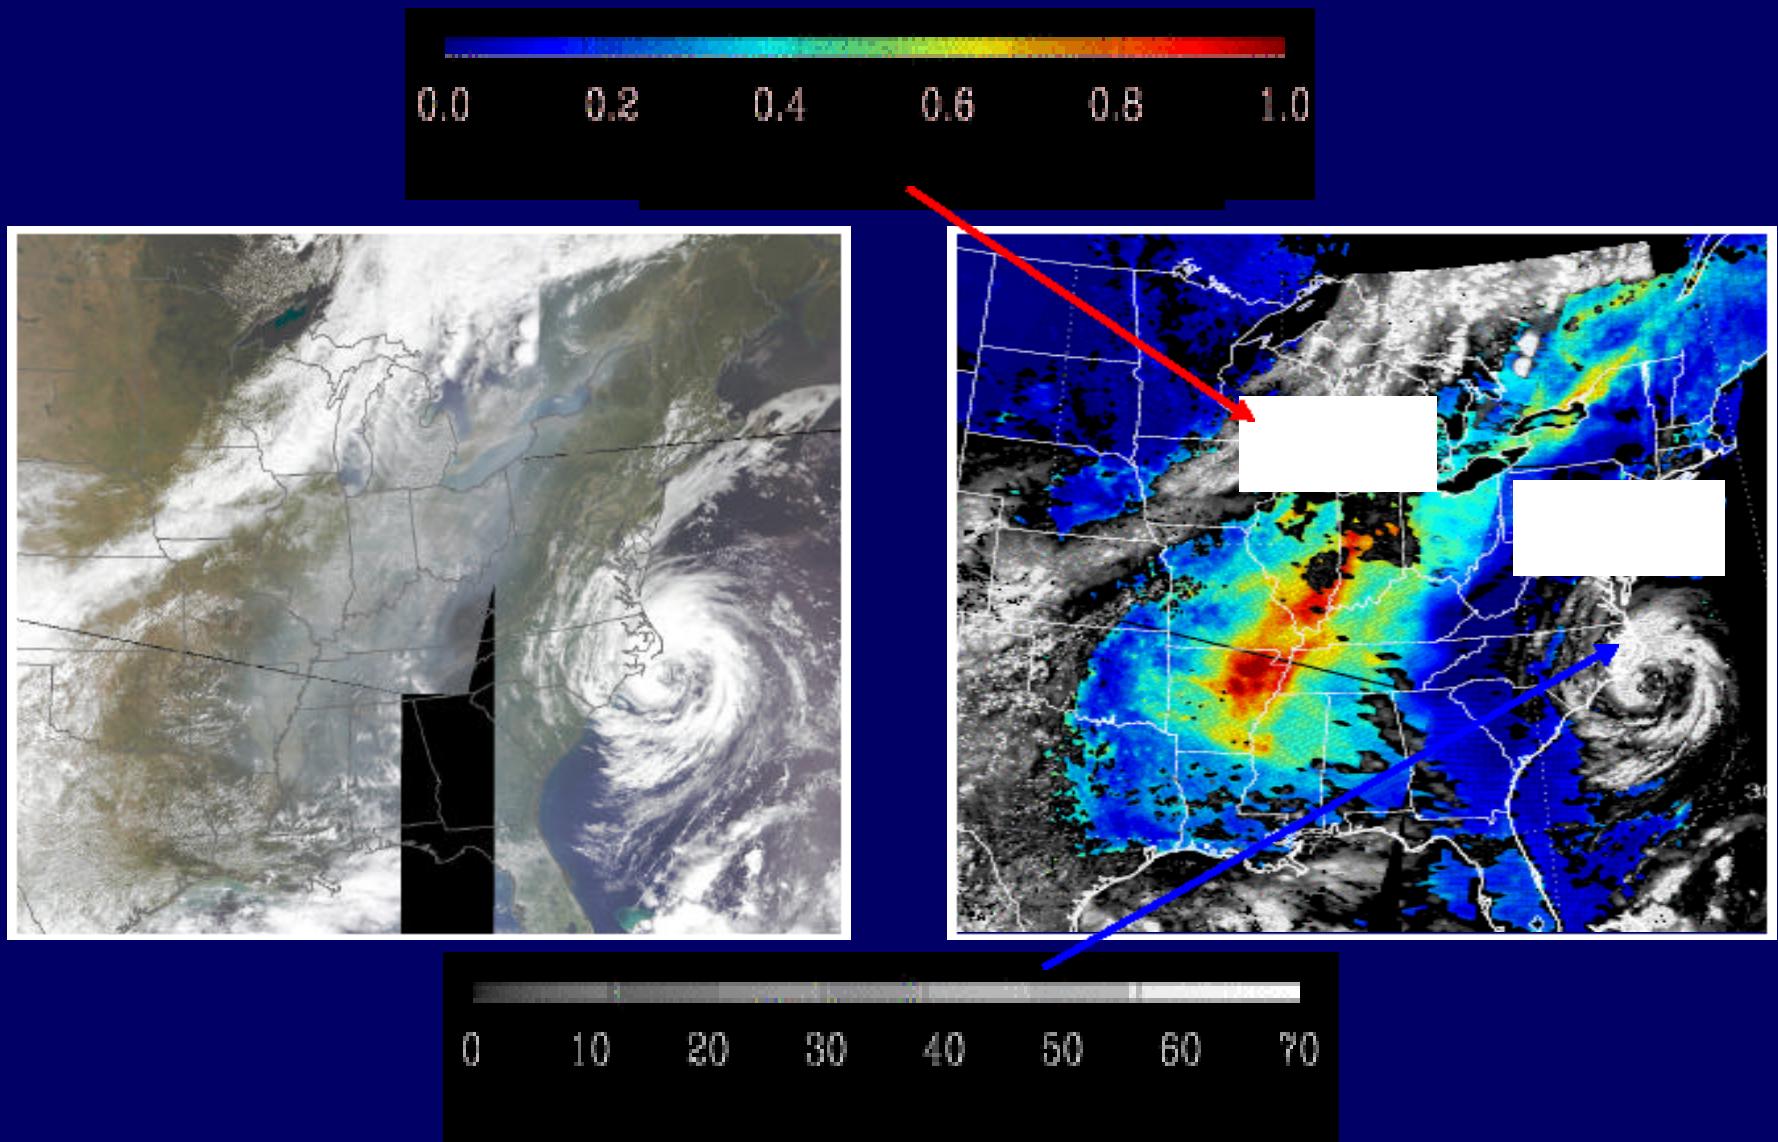

IDEA (Infusing satellite data into environmental air quality applications)

Part of NASA Earth Science Enterprise (ESE) Applications Program strategy to demonstrate practical uses of NASA sponsored observations from remote sensing systems and predictions from scientific research.

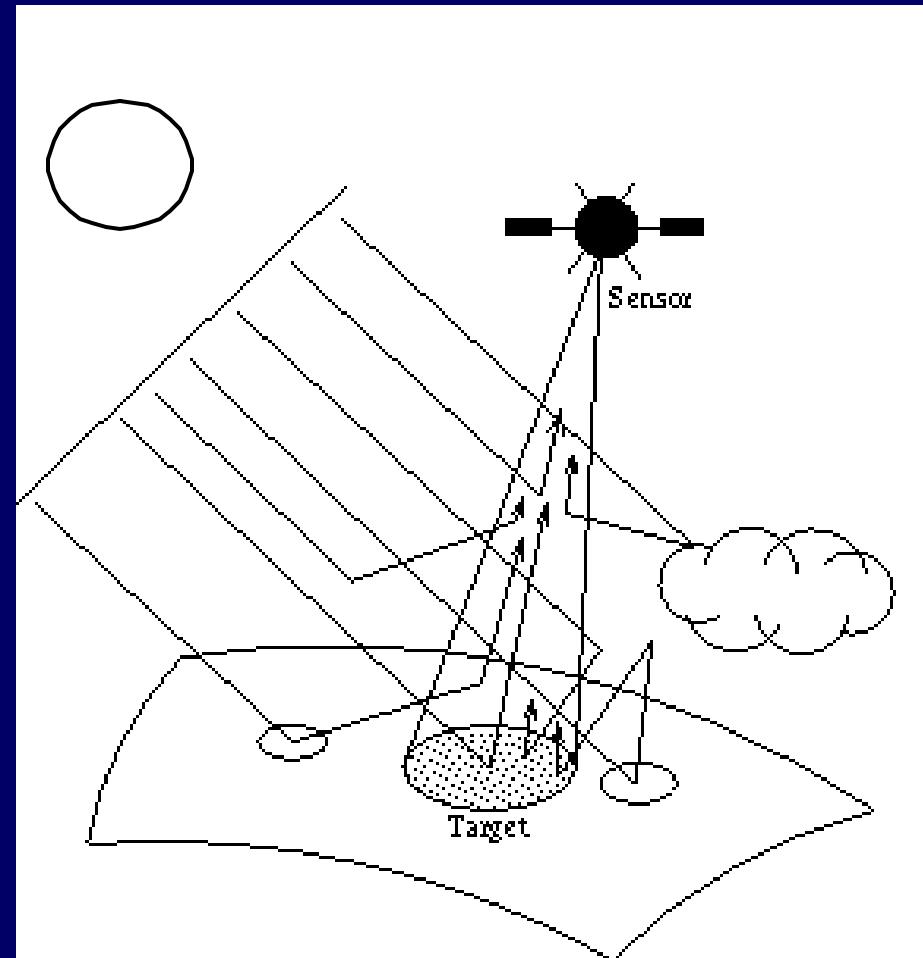

# Visible Image vs. Atmospheric Retrieval MODIS Sensor - Sept. 10, 2002

« Turning the Image into a Chemical Weather Map for Aerosols »

# What the Sensor Signal Measures

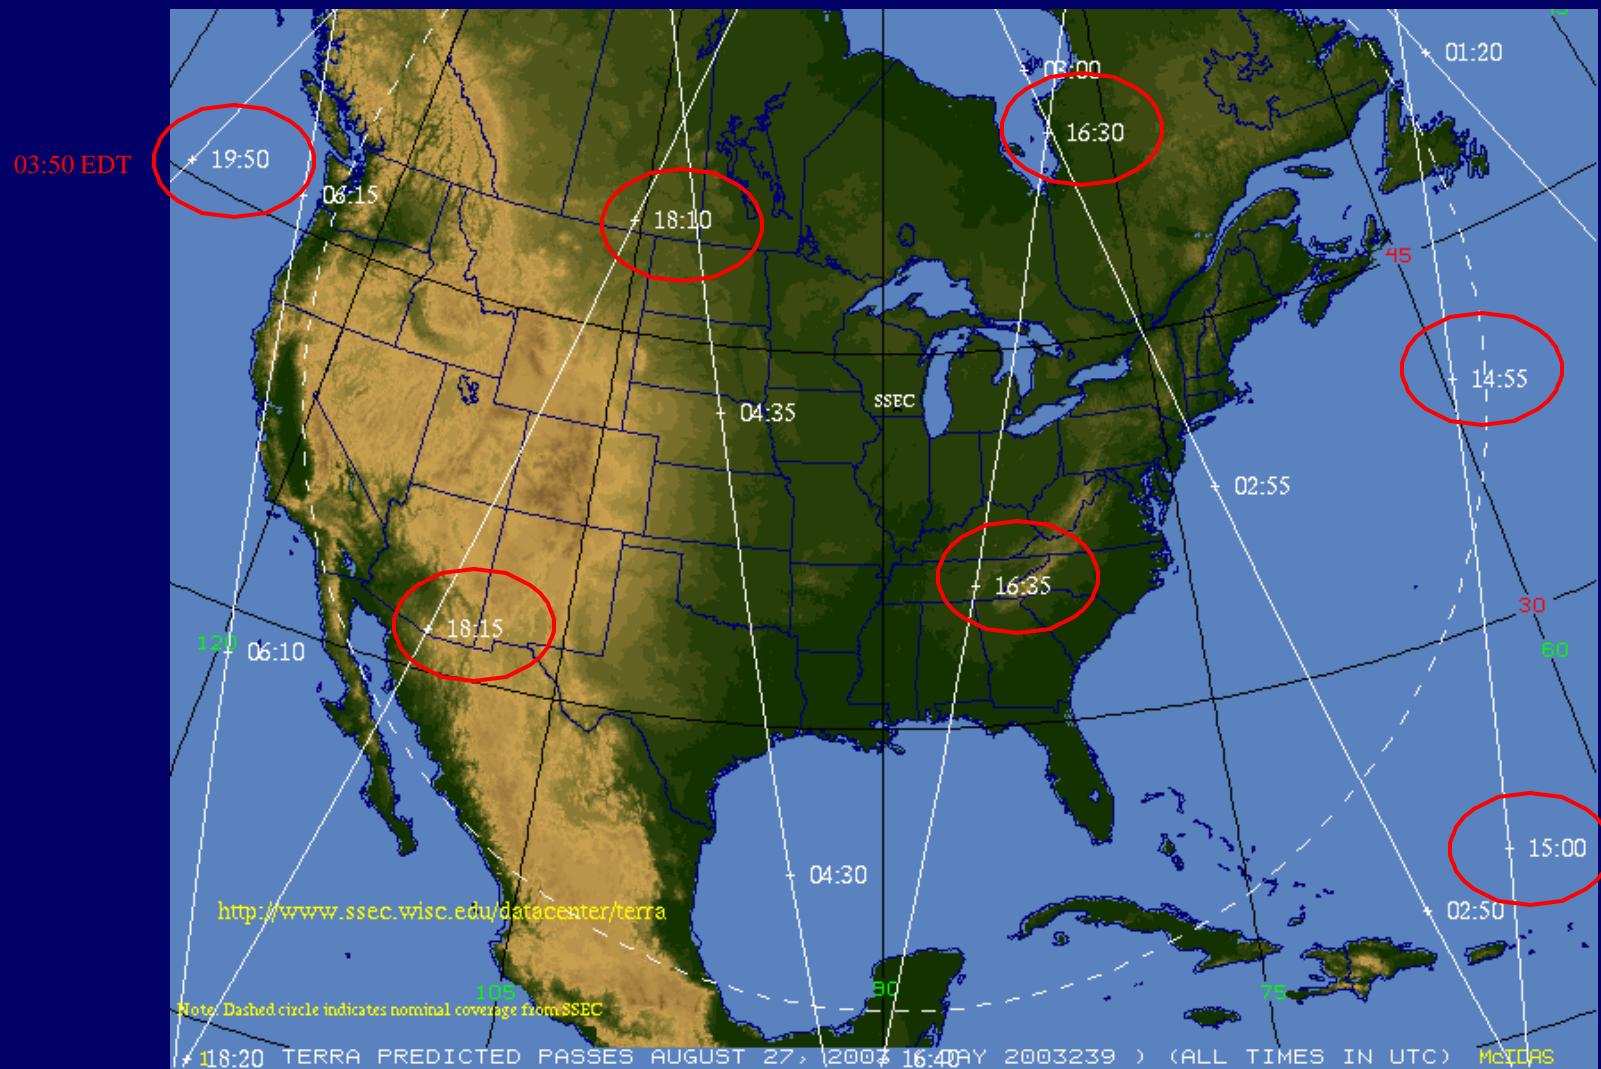

- The MODIS sensor measures solar radiation at different wavelengths and provides a derived column integrated aerosol optical depth.
- The sensor measurement does not provide direct data on the vertical profile of aerosols.
- Integration with meteorological data and ground aerosol measurements can help provide the proper context for the AOD data, making it useful for forecasting.

# Some Details of MODIS $\hat{o}_a$

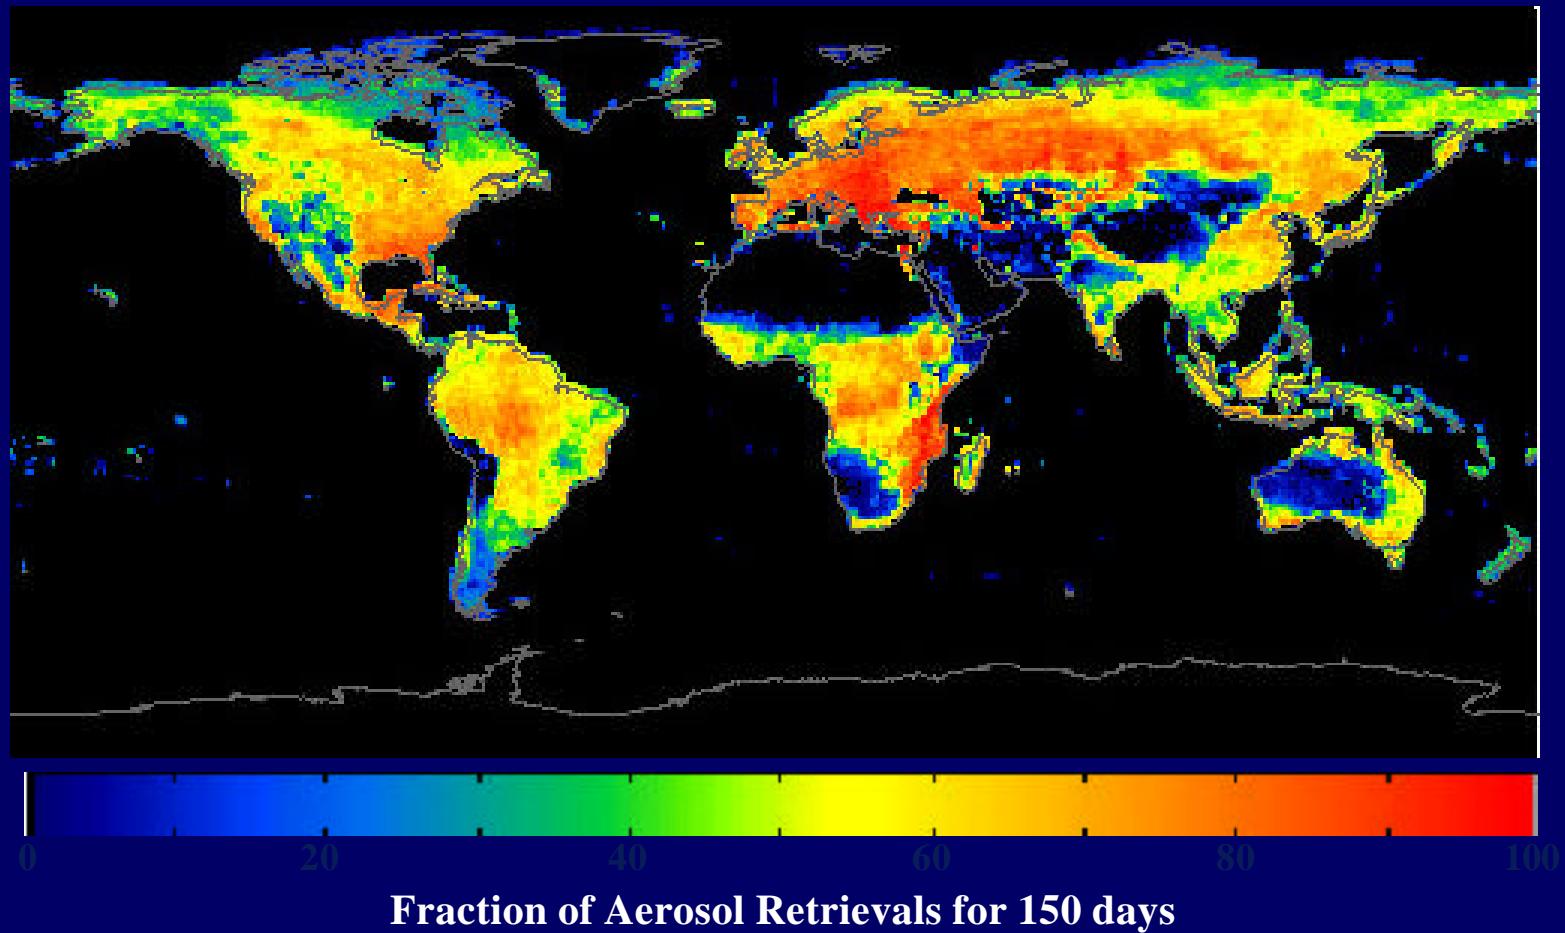

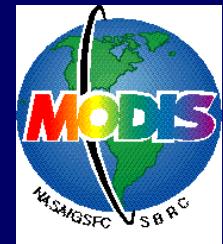

- Current spatial resolution of pixels - 10 km x 10 km
- Different algorithms are used to determine  $\hat{o}_a$  over land and ocean.
  - $\hat{o}_a$  over land are accurate to within their calculated uncertainties  $\pm 0.05 \pm 0.20 * \text{tau}$  (Chu et al., 2002).
  - $\hat{o}_a$  over ocean are accurate to within their calculated uncertainties  $\pm 0.03 \pm 0.05 * \text{tau}$  (Remer et al., 2002)

# NASA MODIS - EPA AIRNow Data Fusion Demonstration Improving Air Quality Index (PM 2.5) Forecasting

**What:** Near-Real-Time Data Fusion of MODIS AOD and EPA AIRNow Data  
(Currently using NOAA Bent Pipe w/ transition to MODIS Direct Broadcast)

**When:** Late August through September 2003

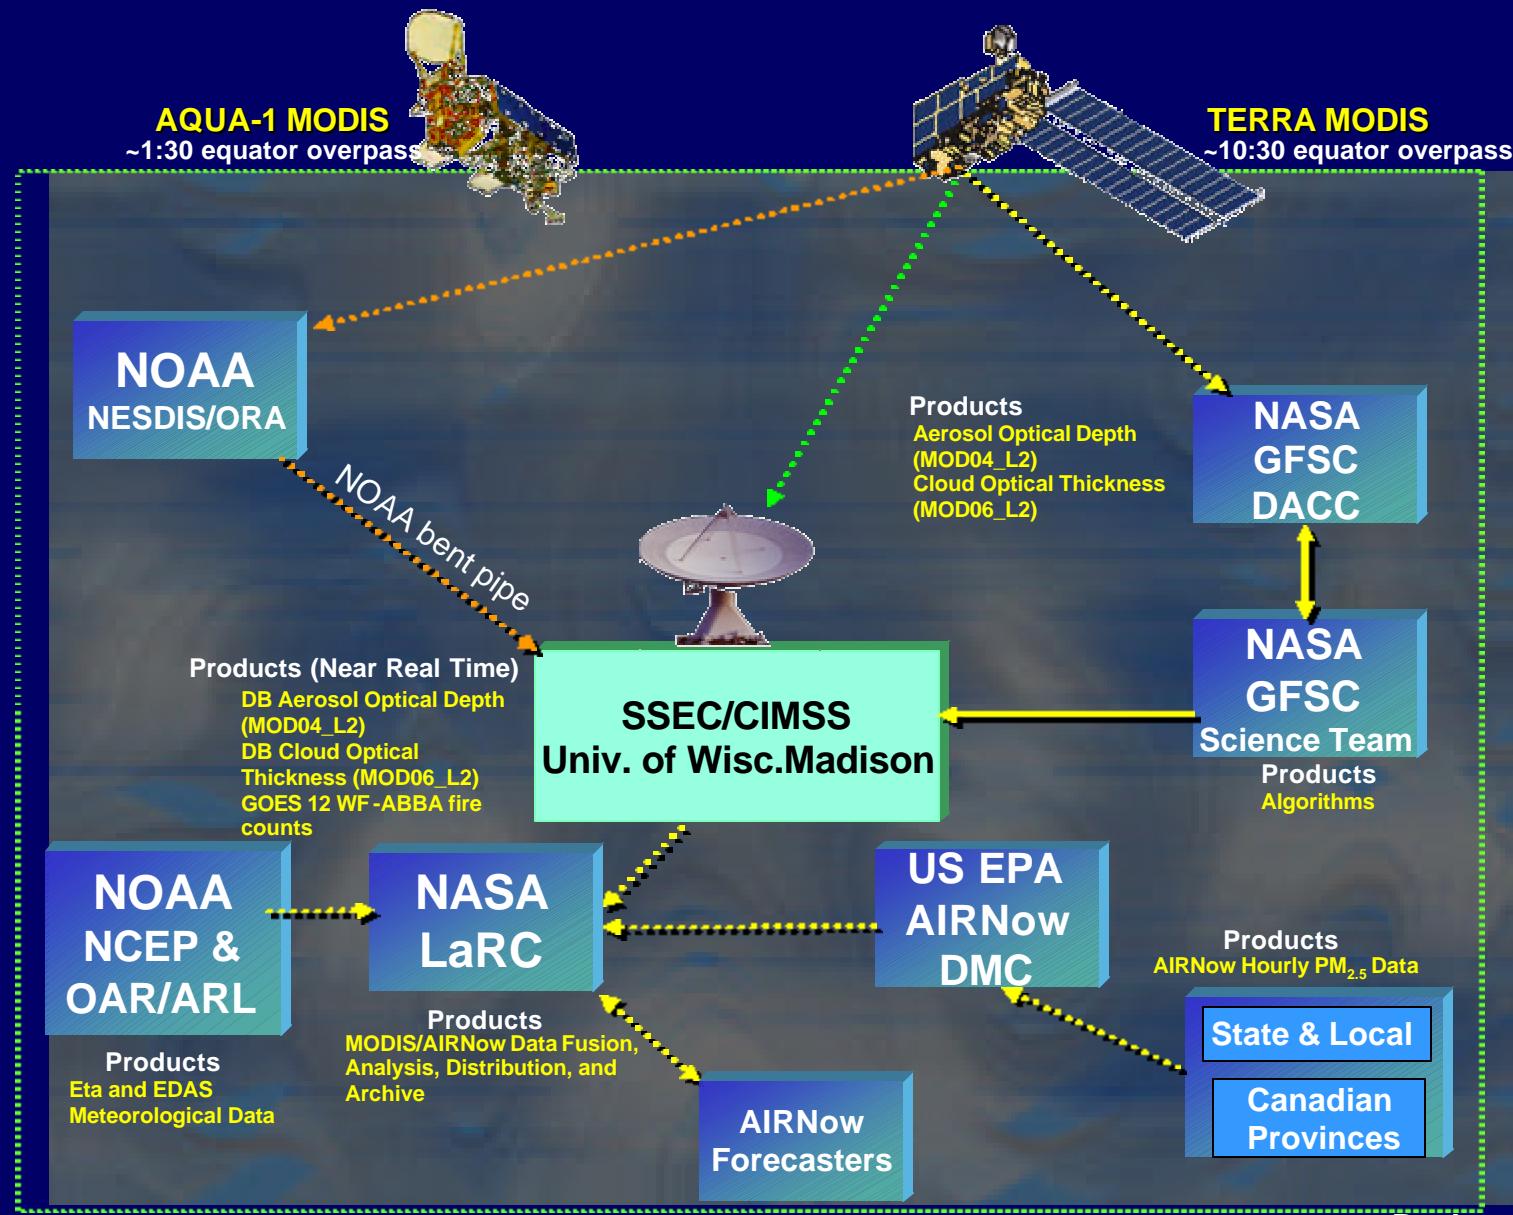

**Who:** NASA LaRC and GSFC  
CIMSS/SSEC Univ. Of Wisc.-Madison & NOAA/NESDIS/ORA  
US EPA OAR/OAQPS  
Select group of Air Quality Forecasters

**Objective:** Prototype a near-real-time product for Air Quality Forecasters

**Goal:** Improve accuracy of next day PM<sub>2.5</sub> AQI forecast during large aerosol events

# Prototype - US EPA AIRNow Use of MODIS Data

Not a Simple Straightforward Accomplishment

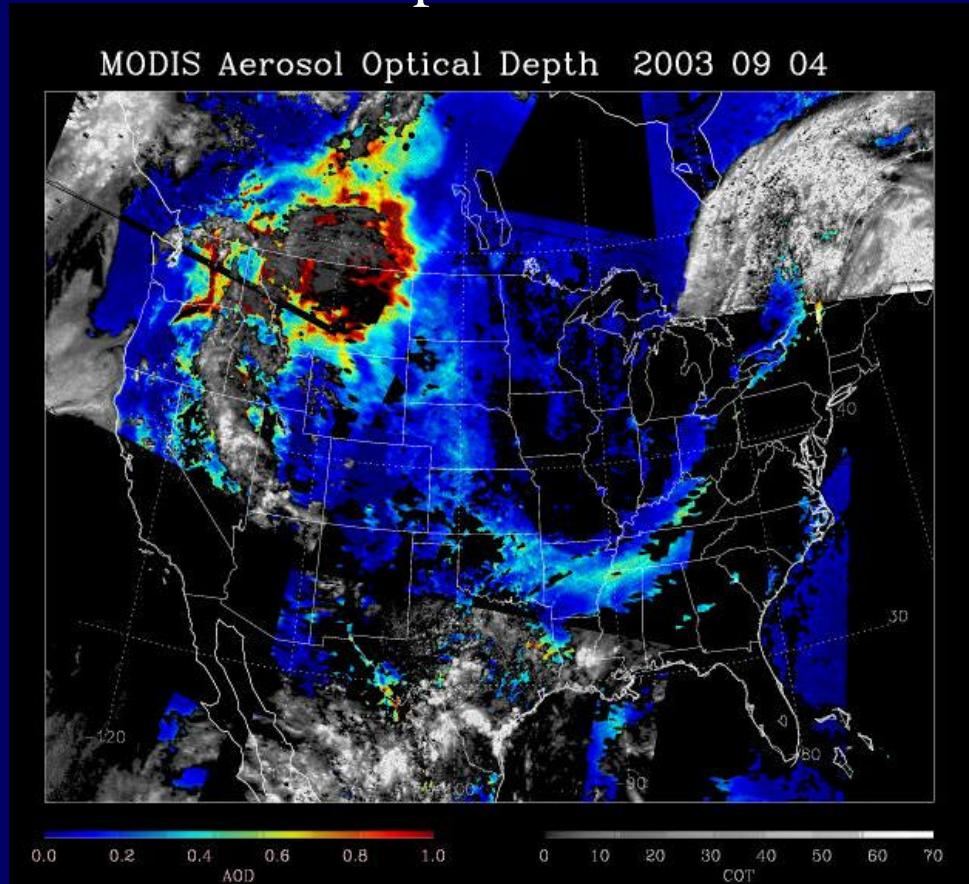

# How Near-Real Time MODIS $t_a$ Aids Forecast

Provides a once daily, pseudo-synoptic view of aerosol loading across North America at a 10 km x 10 km spatial scale

- Regional transport influences
- Natural event influences
- Re-circulation influences

04 September 2003

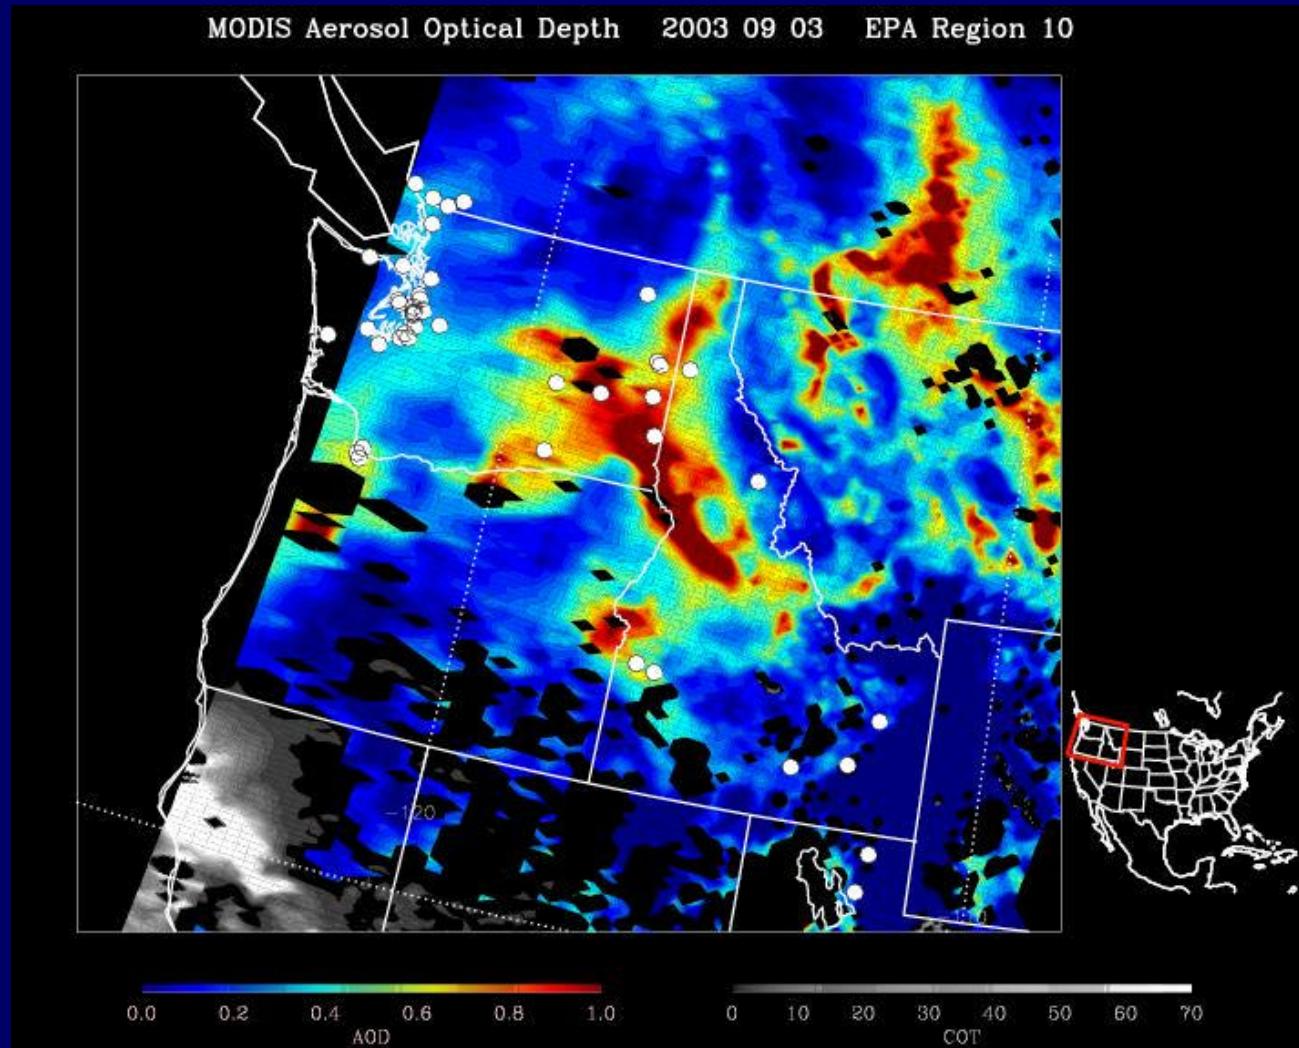

# MODIS/AIRNow Forecast Tool Products

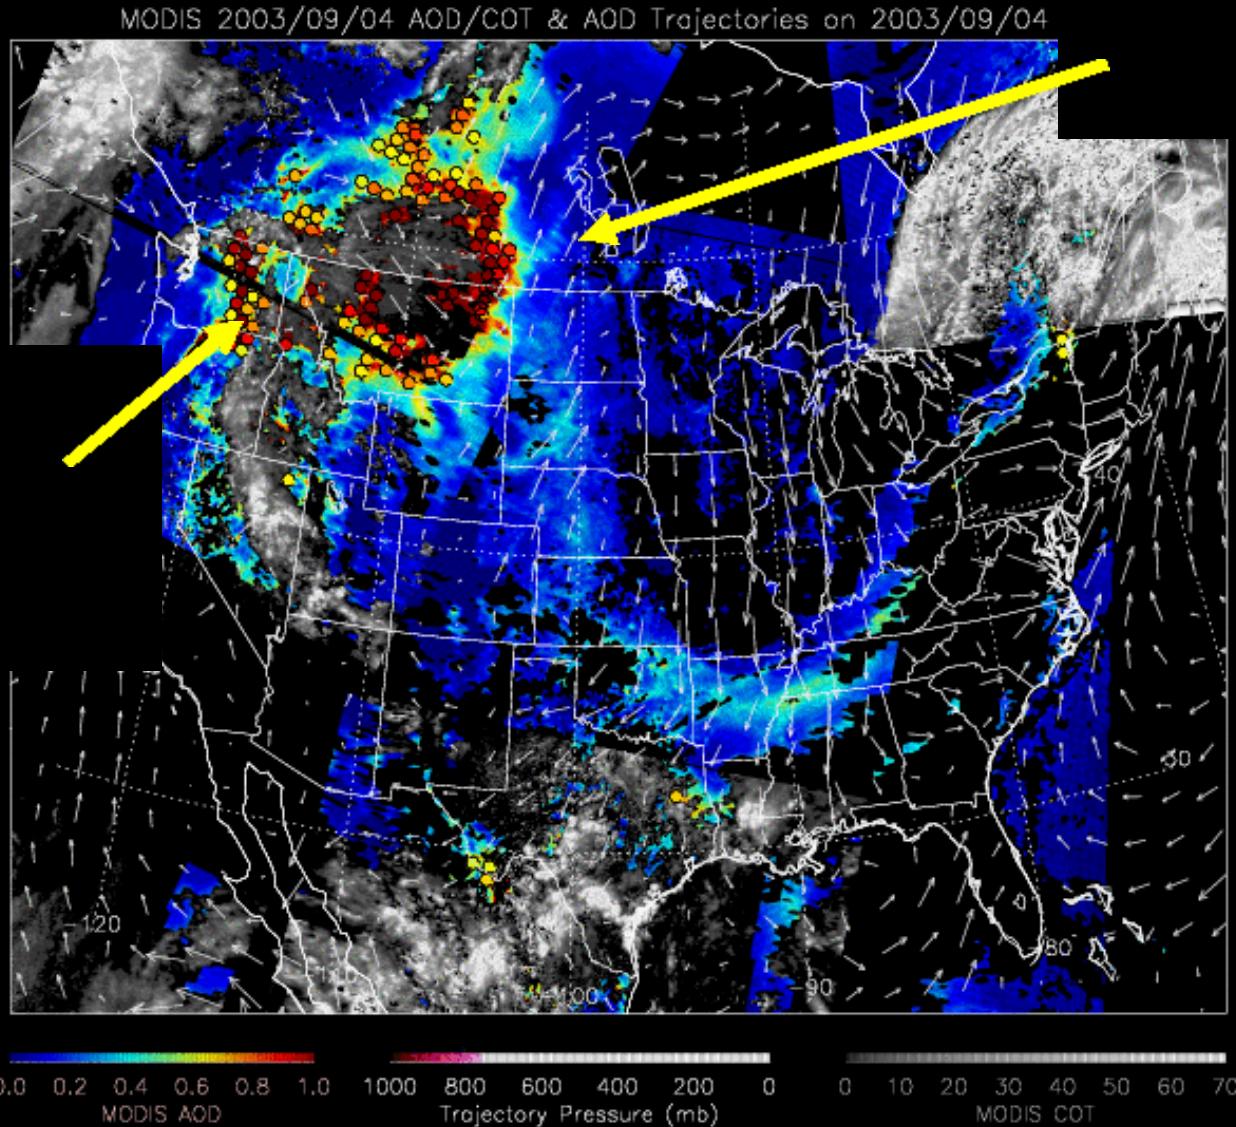

- Regional Summary Plots of MODIS Aerosol Optical Depth and Cloud Optical Thickness
- MODIS Aerosol Optical Depth 48 hour Air Parcel Forecast Trajectories Forecast
- Composite PM2.5/MODIS Aerosol Optical Depth Data Fusion 3-day Animation
- Time-series between MODIS Aerosol Optical Depth and PM2.5 (1hr and 24hr) Mass Concentration
- National Correlation Map between PM2.5 and MODIS Aerosol Optical Depth

# Regional Summary Plots of MODIS Aerosol Optical Depth and Cloud Optical Thickness

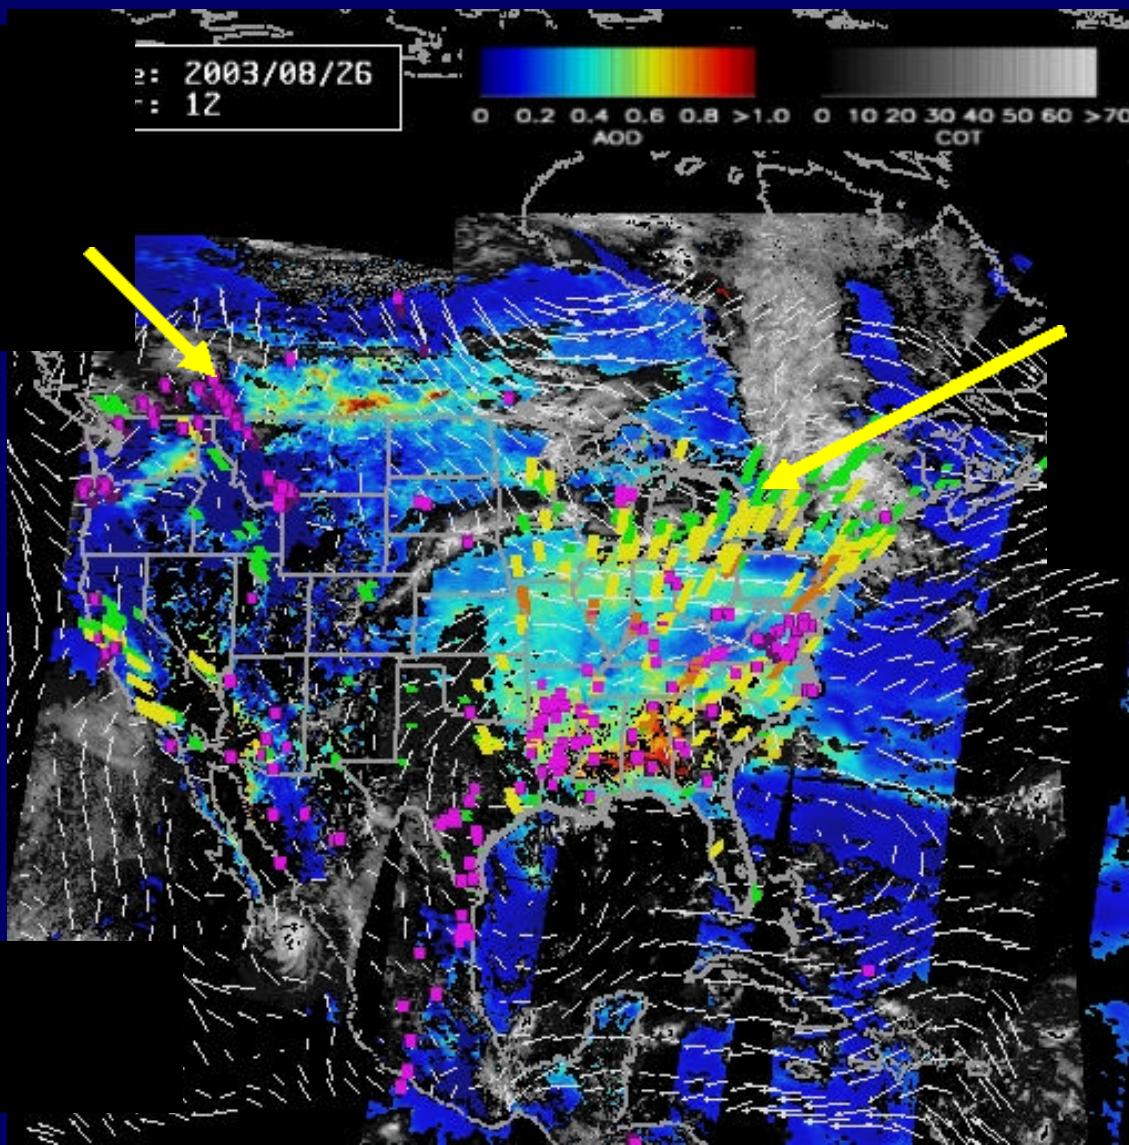

## 03 September 2003

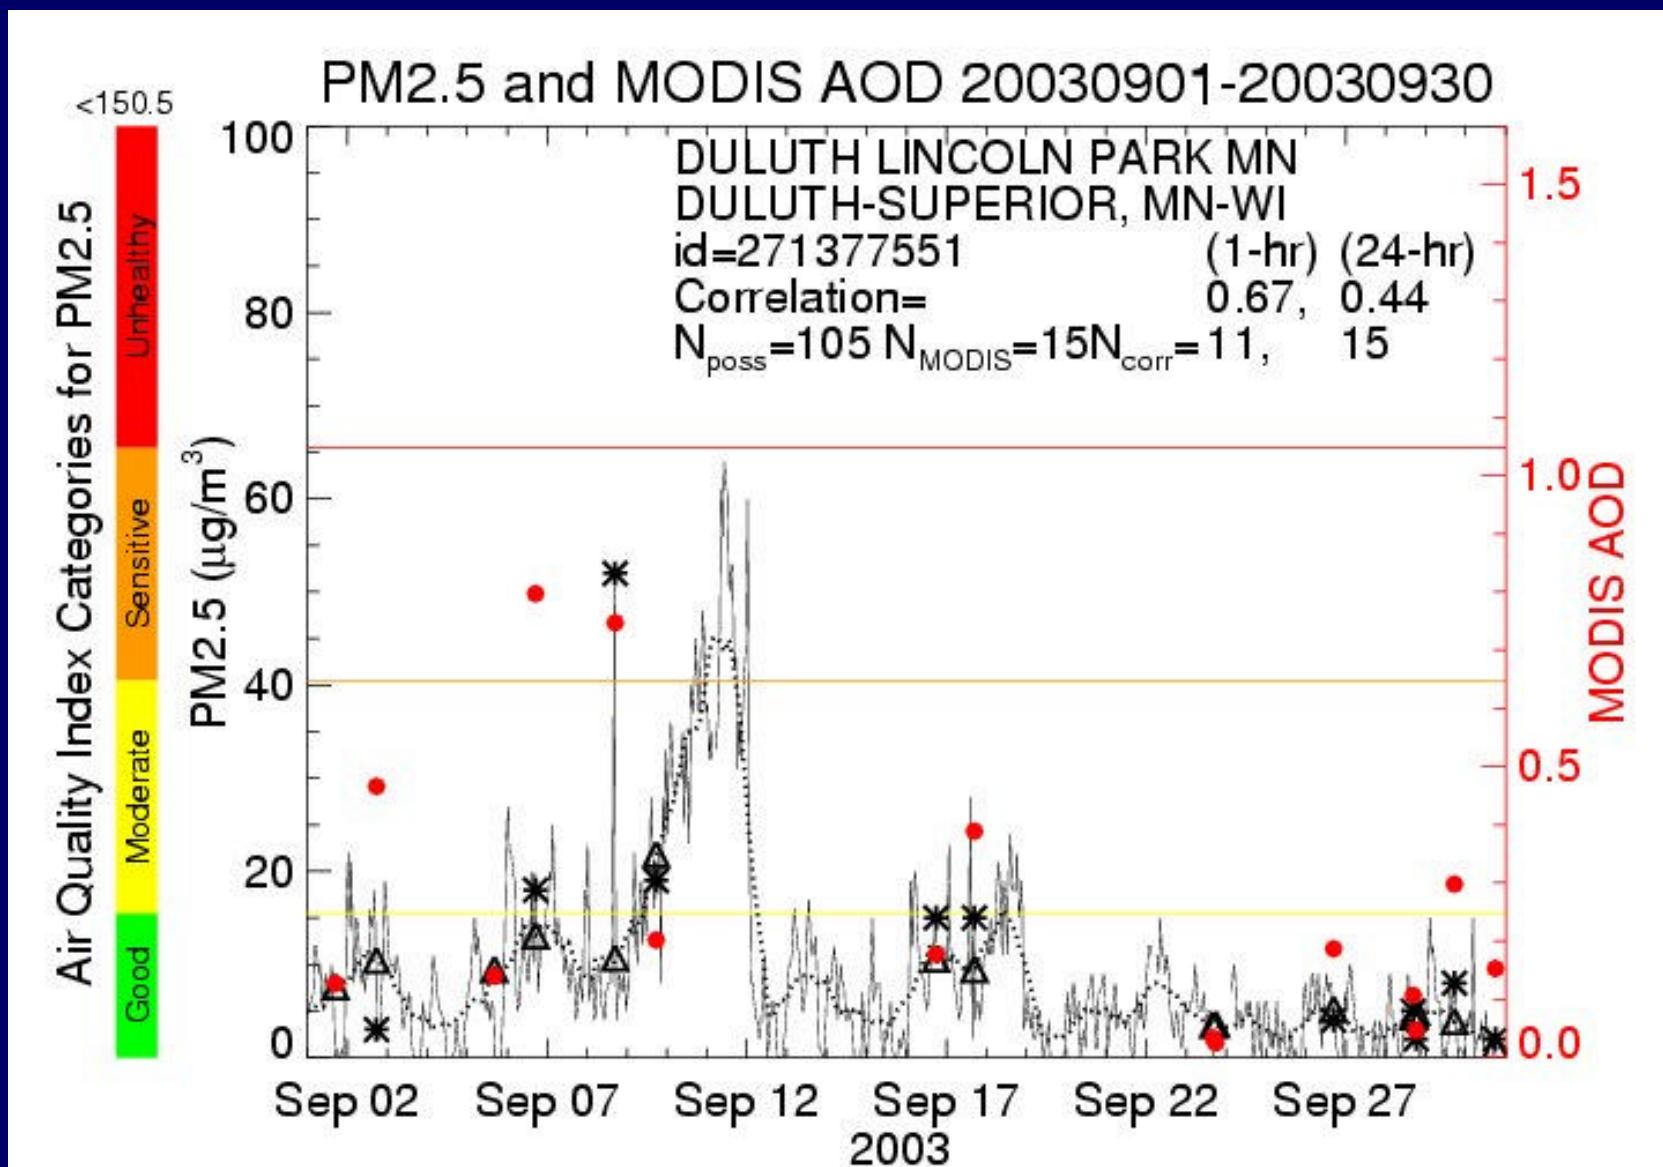

# MODIS Aerosol Optical Depth 48 hour Air Parcel Forecast Trajectories (04 September 2003)

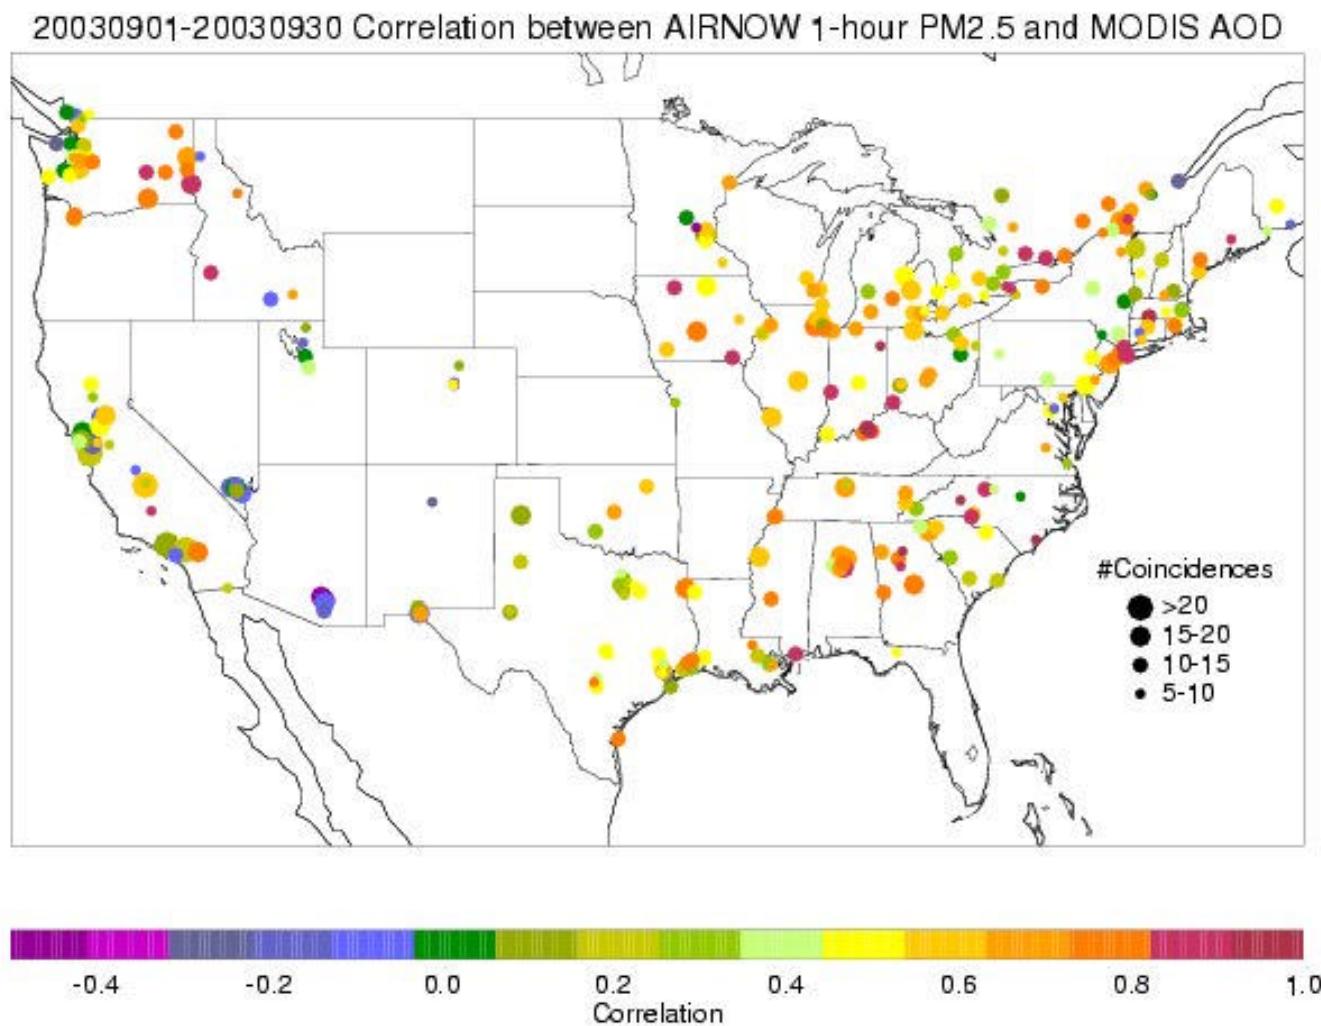

# Composite PM2.5/MODIS Aerosol Optical Depth Data Fusion 3-day Animation

# Time-series between MODIS Aerosol Optical Depth and PM2.5 (1hr and 24hr) Concentrations

# National Correlation Map between PM2.5 Mass Concentration and MODIS Aerosol Optical Depth

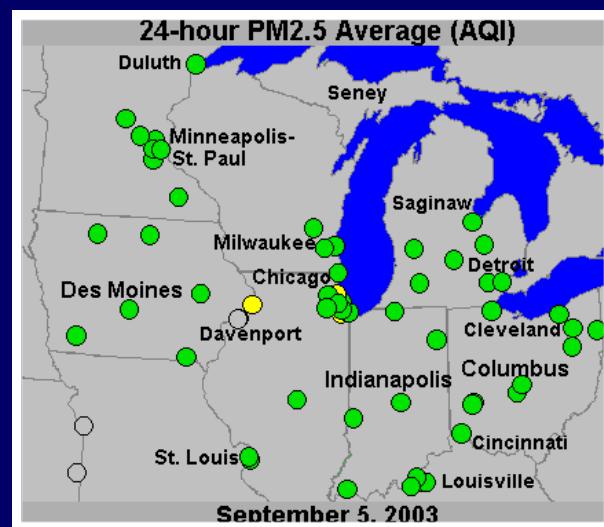

# Operational Use of Satellite Data for Air Quality

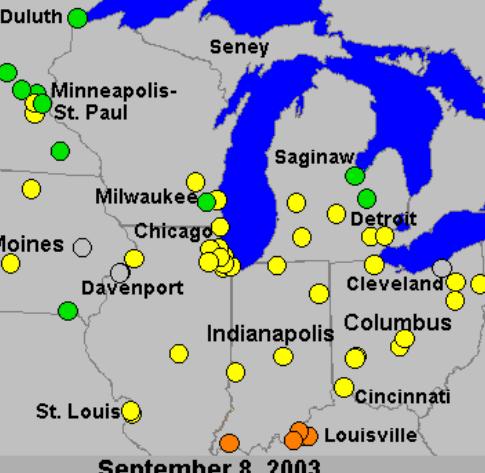

Can satellite data be used in near-real-time to provide synoptic-scale features for air quality forecast?

- PM2.5 levels reached **Moderate** to **Unhealthy for Sensitive Groups** on 8<sup>th</sup> - 12<sup>th</sup> in the Midwest.

48 hour AOD trajectories  
initialized at ~15Z Sep. 7

End of Trajectories #2

## MODIS AOD Sep. 08

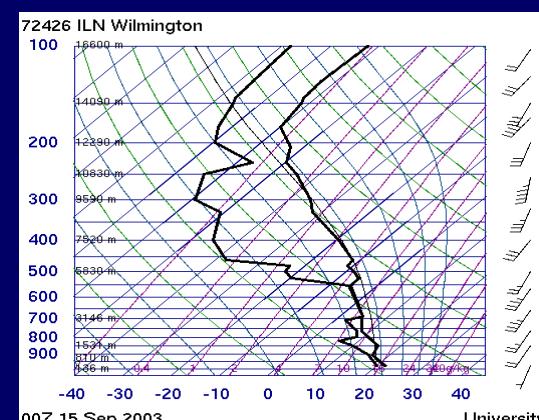

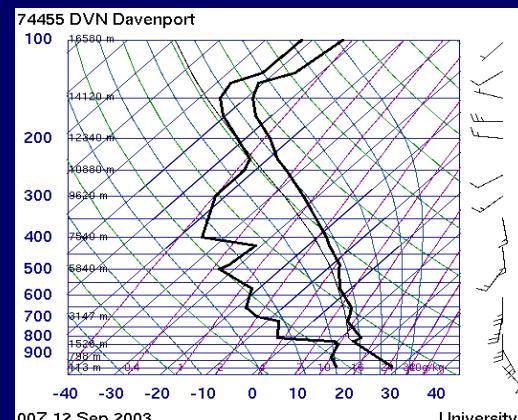

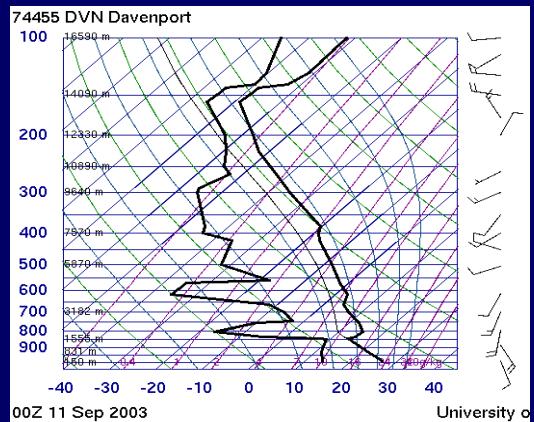

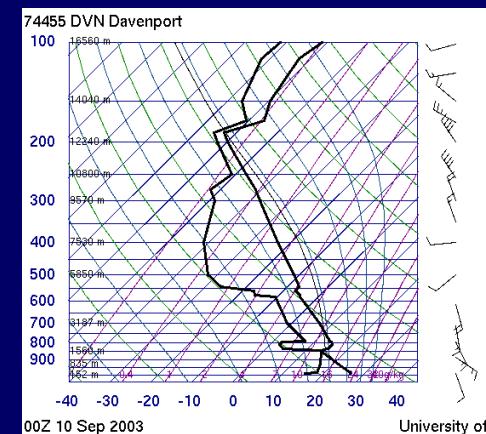

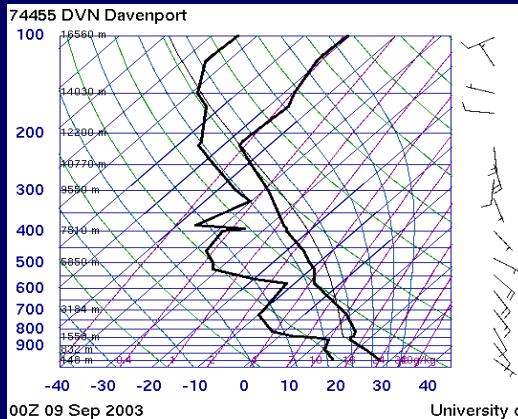

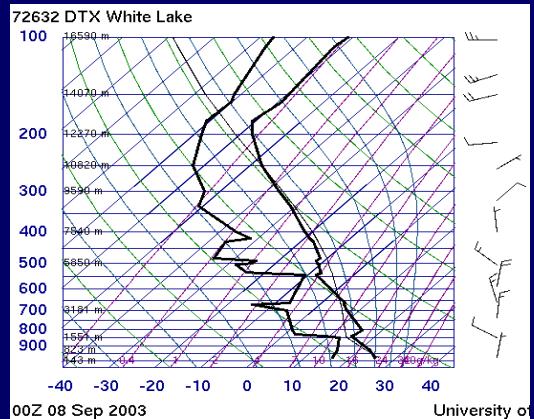

# *Elevated surface PM2.5 influenced by descent of high AOD within high pressure system*

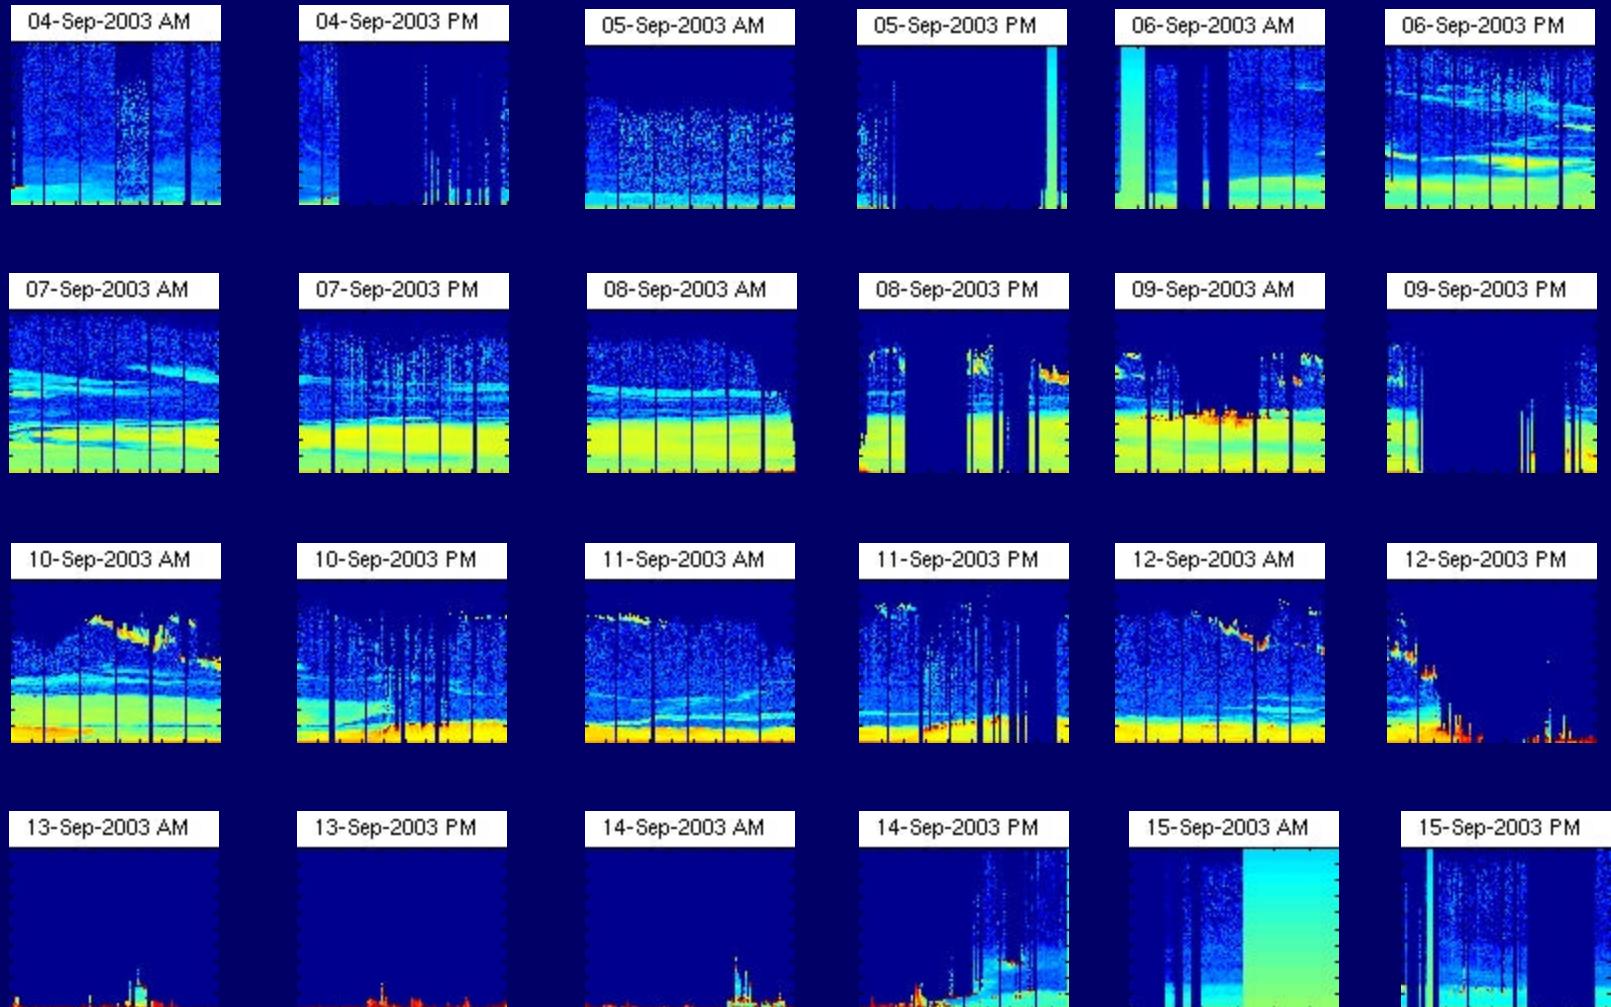

18Z 9/10

# *Midwest soundings show a pronounced inversion existed over September 6 – 15 capping boundary layer ~1.5km*

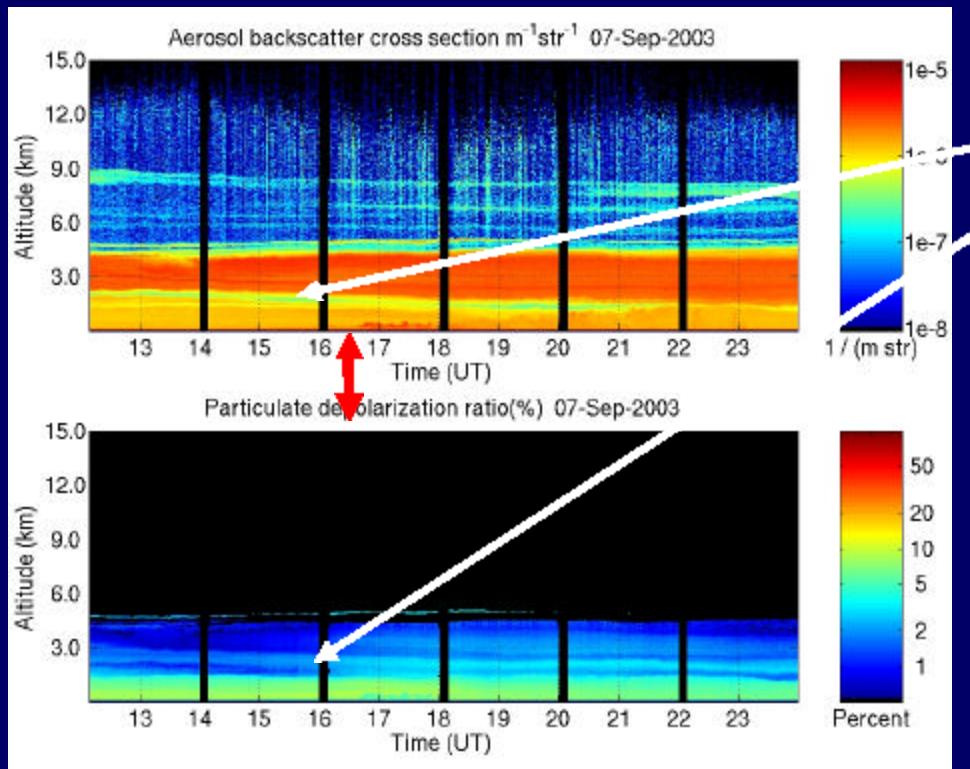

Acknowledgment: MacDonald et al., The Influence of Meteorological Phenomena on Midwest PM<sub>2.5</sub> Concentrations: A Case Study Analysis, 2004 NAQC Short Courses, Baltimore, MD

**High Spectral Resolution Lidar**  
**Aerosol backscatter cross section m<sup>-1</sup> str<sup>-1</sup>**  
**SSEC University of Wisc.**  
**04 – 15 September 2003**

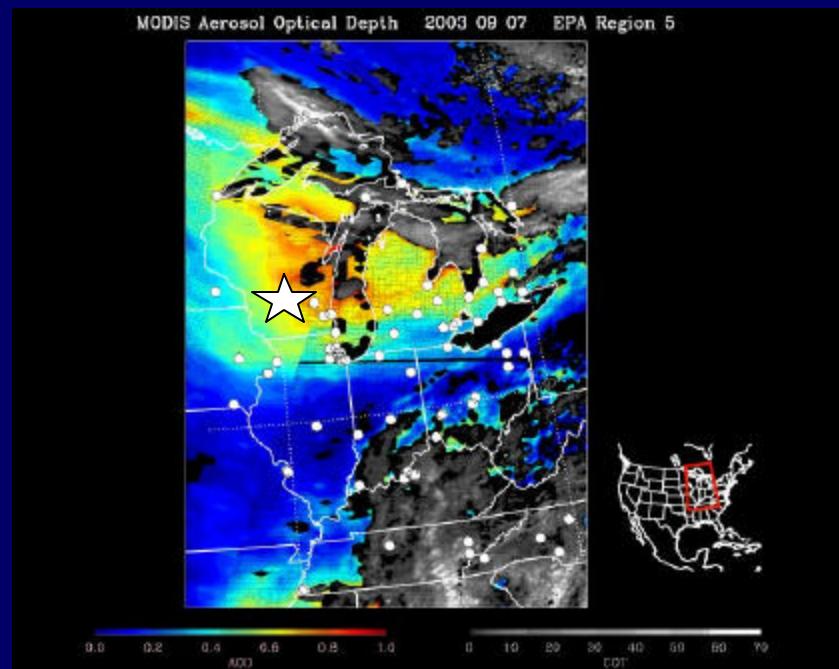

**Source: SSEC University of Wisconsin Lidar Group**

# September 7 SSEC HSRL shows stratified aerosol layers between surface - ~5 km.

HSRL data shows a thin separation between aerosol layers ~1.5km, possibly associated with inversion.

## MODIS AOD Sep. 07

# Summary and Conclusion

- Successfully achieved goal.
  - Fusion and delivery of multiple input data sets in near-real-time.
  - Select group of forecasters routinely used the products to gain an understanding of large scales aerosol events.
- Timeliness of satellite data an issue in forecast cycle.
  - Implementation of MODIS AOD Direct Broadcast will help.
- Case study shows that utilizing satellite and surface observations, combined with trajectory analysis, can provide a powerful tool for monitoring and interpreting PM transport events.

# Summary and Conclusion

- Case study illustrates the importance in proper characterization of the boundary layer.
- Limitations exist due to lack of vertical distributions of aerosols.

# Future Work

- Transition from prototype to a pre-operational stage by late-spring 04.
- Refinements to current products based on forecaster feedback.
- Provide as a pre-operational forecast tool to all AQ forecasters linked with AIRNow.
- Researching feasibility to provide a boundary layer MODIS AOD product.

# MODIS Aerosol Optical Depth ( $\hat{o}_a$ )

*Aerosol optical depth* ( $\hat{o}_a$ ) is a measure of extinction of direct solar beam by transmittance through the atmosphere. (i.e., how much sunlight is prevented from traveling through a column of atmosphere).  $\hat{o}_a$  consists of additive contributions from Rayleigh scattering, gaseous absorption, and aerosol scattering and absorption.

$$\hat{o}_a = \mathbf{\hat{a}}_0^{\text{TOA}} \hat{a}_{ext}(z) dz = \hat{a}_{ext}(0) \times H_{eff} = f(rh) \times Q_{dext}(0) \times m_{dear}(0) \times H_{eff}$$

$f$ ( aerosol type)

**Higher AOD values indicate higher column aerosol loading, therefore lower visibility**

Source: Kaufman and Fraser, 1983

# Some Limitations of MODIS $\hat{o}_a$

- Can not “see” through clouds. If pixel is dominated by clouds, no  $\hat{o}_a$ .
- Present algorithm cannot distinguish between high AOD ( $\hat{o}_a > 3.0$ ) and low COT; result is pixel reported as cloudy.
- Competing processes of surface reflection and aerosol backscatter prevent consistent data retrievals over areas with high surface albedo.
