

Air Quality Data Update 2000-2002 Ozone Air Quality Data

The following is a brief summary of EPA's 2002 air quality update for ozone air quality monitoring data for the three year period, 2000-2002. During this current three year period,

- 30 of the original 98 areas designated nonattainment for the 1-hour O₃ National Ambient Air Quality Standard (NAAQS) in 1991 failed to meet the NAAQS in 2000-2002 (Table 1).
- 3 of the 30 areas have an average expected exceedances greater than 1 but require further review before determining the applicability of the estimate (See Note 5 for Table 1).
- 3 additional counties failed to meet the 1-hour O₃ NAAQS in 2000-2002 (Table 2).
- 297 counties have average annual 4th maximum 8-hour daily maximum O₃ concentrations in 2000-2002 greater than the level of the 8-hour O₃ NAAQS (Table 3).
- 309 counties have average annual 4th maximum 8-hour daily maximum O₃ concentrations in 2000-2002 less than or equal to the level of the 8-hour O₃ NAAQS (Table 4).

The EPA set the 1-hour O₃ standard at 0.12 parts per million (ppm) daily maximum 1-hour average concentration not to be exceeded more than once per year on average. Compliance with the 1-hour ozone standard is judged on the basis of the most recent three years of ambient air quality monitoring data. The 1-hour ozone standard is not met at a monitoring site if the average number of estimated exceedances of the ozone standard is greater than 1.0 (1.05 rounds up). The level of the 8-hour O₃ NAAQS is 0.08 ppm. The 8-hour O₃ standard is not met if the 3-year average of the annual 4th highest daily maximum 8-hour O₃ concentration is greater than 0.08 ppm (0.085 rounds up).

Air quality data from EPA's Air Quality System (AQS) was used to calculate expected exceedances and design values. The specific calculation is explained in the notes for each table. The data used for these calculation was obtained from AQS on August 11, 2003. No regulatory decisions on attainment status have been made for areas based upon these specific calculations. In some cases the data are still under review. In addition, for regulatory decisions, data not in AQS may be informative. Accordingly, further analysis will occur before these design values are used in implementing the national ambient air quality standards for ozone. For information concerning these data contact:

Notes for Table 1:

1. Designations and classifications for ozone nonattainment areas as published in the Federal Register, 40 CFR Part 81. Unclassified and transitional nonattainment areas are not included in Table 1.
2. The updated air quality design value is estimated for the 2000-2002 period using all air quality data reported to EPA's Air Quality System (AQS). The computation procedures follow EPA guidance for calculating design values (Laxton Memorandum, June 18, 1990). For sites with three complete years of monitoring data, the air quality design value is the fourth highest daily maximum 1-hour ozone concentration, because the standard allows one exceedance per year on average. It is important to note that the 1990 Clean Air Act Amendments required that nonattainment areas be classified on the basis of the design value at the time the Amendments were passed, generally the 1987-89 period was used.
3. The level of the 1-hour ozone Ambient Air Quality standard is 0.12 parts per million (ppm) daily maximum 1-hour average concentration not to be exceeded more than once per year on average. The average estimated number of exceedances column shows the number of days the 0.12 ppm 1-hour ozone standard was exceeded on average at the site recording the highest updated air quality value. This computation is performed after adjustment for any missing sampling days during the 3-year period, 2000-2002. The values in parentheses are associated with the monitor with highest average estimated number of exceedances within the designated area; sometimes this statistic is associated with a different site than the site recording the highest updated air quality value.
4. Data reported on http://www.tnrcc.state.tx.us/cgi-bin/monops/ozone_exceedance show Jefferson County, Texas with a design value for 2000-2002 as 144ppb and 2.0 average estimated exceedances.
5. These areas have an average expected exceedances for 2000-2002 greater than 1 but a design value that is less than 0.125 ppm. Further review will be required before determining the applicability of the estimated design value due to less than 3 valid years of data.
6. Sites in Kenosha County Wisconsin have been used, by previous agreement, for the design value sites in both Chicago, IL and Milwaukee, WI.

Table 2. Additional Counties that fail to meet the 1-hour Ozone NAAQS in 2000-2002

State	Designated Area	O3 Design Value (ppm)¹	Average Estimated Exceedance Rate
GEORGIA	Athens, GA ²	0.110	1.1
GEORGIA	Macon, GA	0.125	1.3
INDIANA	LaPorte CO	0.135	2.0

Notes for Table 2:

1. The updated air quality design value is estimated for the 2000-2002 period using all air quality data reported to EPA's Air Quality System (AQS). The computation procedures follow EPA guidance for calculating design values (Laxton Memorandum, June 18, 1990). For sites with three complete years of monitoring data, the air quality design value is the fourth highest daily maximum 1-hour ozone concentration, because the standard allows one exceedance per year on average. It is important to note that the 1990 Clean Air Act Amendments required that nonattainment areas be classified on the basis of the design value at the time the Amendments were passed, generally the 1987-89 period was used.
2. These areas have an average expected exceedances for 2000-2002 greater than 1 but a design value that is less than 0.125 ppm. Further review will be required before determining the applicability of the estimated design value due to less than 3 valid years of data.

WISCONSIN	SHEBOYGAN	55	117	0.099

Notes:

1. The level of the 8-hour ozone (O₃) National Ambient Air Quality Standard (NAAQS) is 0.08 parts per million (ppm). The air quality design value for the 8-hour O₃ NAAQS is the 3-year average of the annual 4th highest daily maximum 8-hour average O₃ concentration. The 8-hour O₃ NAAQS is not met when the 8-hour ozone design value is greater than 0.08 ppm (85 ppb rounds up).
2. The design value for Tulsa County is 0.087 ppm if, as presented on the Oklahoma's Department of Environmental Quality website, flagged data is considered in the calculation. See: the Skiatook site listed in the table at <http://www.deq.state.ok.us/AQDNew/monitoring/charts/oz8h r-02.htm> .
3. Data reported on http://www.tnrcc.state.tx.us/cgi-bin/monops/8hr_4highest show Jefferson County, Texas with a design value for 2000-2002 as 90ppb.

Table 4. Counties Meeting the 8-hour Ozone NAAQS, 2000-2002
