RE: Exide Technologies - Reading, Pennsylvania  
Bernhart Park Results

Dear Mr. Dao:

This letter was prepared on behalf of Exide Technologies (Exide) and pursuant to the reporting requirements in Section 3.0 of the Bernhart Park Sampling Work Plan (Work Plan) revised July 5, 2001. Specifically, this letter provides documentation of the sampling activities and the associated sample results.

Per the Work Plan, three composite (0"-3") soil samples were collected from each half-acre Exposure Area (EA) within the park's boundaries (Table 1). Each EA was surveyed using GPS and divided into four separate and approximately equal quadrants. Approximate EA boundaries were pre-determined using a base map of the area and CADD; in a few cases, the EA boundaries were modified in the field based on actual field observations. Modification of an EA was largely determined by the accessibility of a given EA to the local population and all EA modifications were approved by Khai Dao of the USEPA. The soil samples were collected and prepared per the Work Plan and were analyzed by XRF with twenty percent of the samples being sent to the laboratory (MJ Reider) for correlation purposes. Table 2 shows the XRF and laboratory sample results used for correlation purposes. Figure 1 shows the graph of the data with the linear trend line, correlation equation, and the  $R^2$  value. The  $R^2$  value of 0.96 shows a strong correlation between the XRF and the laboratory data. An  $R^2$  value greater than 0.8 is generally considered acceptable and useful, while a value greater than 0.9 is considered excellent. Given the strong correlation, a trend line equation was used to correct the XRF data, as presented in Table 3. A mean value, using the corrected XRF data, was then calculated for each EA as presented in Table 3. The EA boundaries and mean values are also shown on Figure 2.

Mr. Khai Dao  
2001-810-10  
August 10, 2001  
Page 2 of 6

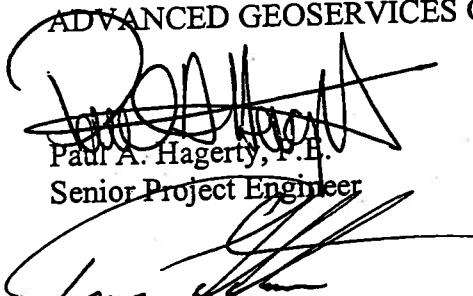

In accordance with the Work Plan, sediment (0"-3") and aqueous samples were collected from fifteen random locations within the reservoir, as shown on Figure 2. Aqueous samples were collected prior to sediment sampling and at two depths; 3' below the water surface and 3' above the sediment surface. In addition, aqueous samples were collected at the inlet and discharge points of the reservoir, as shown on Figure 2. All aqueous samples were analyzed and found to be less than 0.05 mg/l. This concentration has been defined by the PADEP (PA Code 25:16.51) as being protective of human health. The results of sediment, water, and field parameters are presented in Tables 4, 5, and 6, respectively. All laboratory data were validated by AGC and validation reports are provided in Attachment A.

Exide has performed a risk assessment based on the new data set and has concluded, as with the original risk assessment dated April 26, 2001, that no significant elevations in blood lead levels are expected due to Park usage. The risk assessment is included with this submission as Attachment B.

We hope that this information will aid USEPA in expeditiously re-opening the Park. Please contact Paul Hagerty at (610) 675-2113 with any questions regarding this submission.

Respectfully,

ADVANCED GEOSERVICES CORP.

  
Paul A. Hagerty, P.E.  
Senior Project Engineer

  
Paul G. Stratman, P.E.  
Senior Project Consultant

Bernhart Outlet Total	<0.05
Bernhart Outlet Dissolved	<0.05
Bernhart SED Pond Total	<0.05
Bernhart SED Pond Dissolved	<0.05

Note 1: WA samples taken at 3 feet below surface.

Note 2: WB samples taken at 3 feet from bottom.

Note 3: WC and WE samples are duplicates of WA samples.

Note 4: WD and WF samples are duplicates of WB samples.

Note 5: MDL = Method Detection Limit
