

EPA SBIR Solicitation Topics

The next EPA SBIR solicitation is anticipated to open in June 2024. Specific topic areas change from year to year. For reference, the 2023-2024 topics were:

Clean and Safe Water

- Zero-liquid discharge and brine concentrate minimization
- Treatment and destruction of PFAS in wastewater and other waste streams
- HABs sensors that can monitor cyanobacteria and toxins

Air Quality & Climate

- Innovative technologies to clean indoor air during wildfire smoke events and other high pollution days
- Air pollution control technologies for urban small sources

Land

- Innovations in slurry injection technology for complex waste treatment and disposal

Homeland Security

- AI-based indoor mapping and localization using smartphone sensor data

Circular Economy/Sustainable Materials

- Innovative technologies that help consumers prevent food waste in the acquisition, preparation, and storage of food
- Innovative technologies or materials that will improve the U.S. recycling system
- Innovative material reduction and reuse solutions to lower embodied carbon in the built environment

Safer Chemicals

- Rubber anti-degradant technologies for tires and other rubber products that are lower concern for human health and the environment
- Innovative enhanced efficiency fertilizers

EPA's SBIR Program

The U.S. Environmental Protection Agency's (EPA) mission is to protect human health and the environment. EPA's SBIR Program supports small businesses (500 or fewer employees) to develop and commercialize novel environmental technologies that support this mission.

PHASE I

Phase I awards are \$100,000 for six months and for "proof of concept" of the technology.

PHASE II

Phase II awards are for up to \$400,000 for two years to further develop and commercialize the technology. Phase II companies that obtain qualifying third party investments are eligible for a commercialization option of \$100,000.

SBIR Success Stories

Providence Photonics

Providence Photonics developed the Video Imaging Spectral Radiometer (VISR) to remotely measure flare combustion efficiency in real time. This optical gas imaging technology allows operators to minimize emissions from flaring, which also reduces the cost of complying with regulations. This technology has been deployed to hundreds of flares on onshore and offshore facilities across the world.

Industrial Microbes

Industrial Microbes engineered a microbe that converts waste gases such as CO₂ and methane into useful materials such as synthetic fibers and biodegradable plastics. Compared to current methods, this process emits six times less CO₂. Industrial Microbes secured private investment and were named one of Biofuel Digest's Next 50 Companies to Disrupt the World.

Lucid Design Group Inc.

Lucid Design Group Inc. developed a software that drives energy conservation and savings in commercial buildings. Real-time electricity usage data is used to change the ambient color of LED lights to show building occupants how much energy they are using to help reduce energy usage and allow businesses to meet sustainability goals. Lucid's software has been used by more than 500 businesses in over 15,000 buildings. Lucid was acquired by Acuity Brands, Inc. to enhance their base of networked sensors for lighting and building automation controls.
