Dear Mr. Spurlin:

Weston Solutions, Inc., Superfund Technical Assessment and Response Team - 2 (START-2) is submitting one copy of the Final Removal Action Letter Report for the Red Panther site located in Clarksdale, Coahoma County, Mississippi.

Please contact me at (770) 325-7968, or Greg Harper at (770) 325-7972, if you have any questions or comments regarding this letter report.

Sincerely,  
Weston Solutions, Inc.

A handwritten signature in black ink, appearing to read "Timothy J. Maher".

## **1.0 INTRODUCTION**

This document has been prepared in accordance with Technical Direction Document (TDD) No. 4W-02-07-B-007, which the United States Environmental Protection Agency (EPA) assigned to the Weston Solutions, Inc., (Weston) Superfund Technical Assessment and Response Team - 2 (START-2). The scope of this TDD, monitored by EPA On-Scene Coordinator (OSC) Steve Spurlin, was to provide oversight of the removal and site restoration activities conducted by the Potentially Responsible Parties' (PRPs) contractors.

## **2.0 SITE BACKGROUND**

This section describes previous investigations and source areas at the site.

### **2.1 SITE HISTORY**

The Red Panther Chemical site consists of approximately 6.5 acres and is located at 550 Patton & Leflore Roads, Clarksdale, Coahoma County, Mississippi (see Site Location Map in Attachment 1). The facility is bordered to the north by Graeber Brothers, to the south by Master Mix Concrete, Inc., to the east by Normandy Avenue and the west by East Tallahatchie Street (see Site Diagram in Attachment 1). During its operational period, wastewater from the formulating process was routinely released, resulting in contamination of the property with a wide variety of pesticides and arsenic. The property is currently used by Coahoma, Inc. as a storage facility for seeds, cotton and farm chemicals.

The Red Panther Chemical facility operated as a pesticide formulation plant between 1949 and 1978 producing liquid and dry herbicides, insecticides, and fungicides, including toxaphene, aldrin, arsenic and DDT. Previous owners of the facility include Coahoma Chemical Company, Riverside Chemical Company and MFC Services.

In 1980, the Red Panther facility filed a Resource Conservation and Recovery Act (RCRA) hazardous waste management activity notification and Part A application for the storage of wastewater and used solvents on the site. Wastewater containing pesticide and solvent residues were generated from the cleaning of equipment at the facility. It is not clear whether a storage permit was granted at this time.

In November of 1985, the Mississippi Bureau of Pollution Control (MBPC) granted the facility a RCRA Part B permit to store wastewater and spent solvents at the site. Prior to obtaining the RCRA permit, wastewater and spent solvents were discharged directly to an offsite ditch or into an underground leaching field on the property.

## 2.2 PREVIOUS INVESTIGATIONS

In 1984, the MBPC conducted an inspection of the site. Environmental samples taken from in and around the site during this inspection were found to contain detectable levels of chlorinated pesticides and arsenic.

In 1999, the EPA tasked their Superfund Technical Assessment and Response Team (START) to conduct surface and subsurface soil sampling of the drainage ditches to the east of the property, the former onsite leaching field and septic tank on the north side of the property, and the rail spur in front of the loading dock that runs along the west side of the property. The results from this sampling event indicated that the site was contaminated with arsenic, organochlorinated pesticides, and their degradation byproducts including, but not limited to, aldrin, chlordane, dieldrin, 4,4'-DDT, endrin, endosulfan II and toxaphene.

In September of 2001, an Administrative Order on Consent (AOC)(Ref. 1) between the Performing PRPs and EPA Region IV was finalized. The AOC identified four constituents of concern (COCs) for surface soil criteria and three COCs for subsurface soil criteria. The surface COCs were identified as; arsenic, toxaphene, dieldrin and total chlorinated pesticides. The surface soil action levels defined in the AOC for these compounds were 23 parts per million (ppm), 39 ppm, 3 ppm, and 100 ppm respectively. The subsurface COCs were identified as, arsenic, toxaphene, and dieldrin. The subsurface soil action levels

defined in the AOC for these compounds were 270 ppm, 220 ppm, and 15 ppm respectively.

The PRPs retained NewFields and URS Corporation (URS) to perform a soil characterization at the site (Refs. 2; 3), develop a Sampling Analysis Plan (SAP)(Ref. 4), a Quality Assurance Project Plan (QAPP)(Ref. 5), a Site Safety and Health Plan (SSHP)(Ref. 6), and a Phase II Removal Action Final Design Work Plan (Ref. 7). Phase I of the work plan addressed the removal of contaminated soil from the drainage ditches on the perimeter of the property, soil characterization of areas to be addressed during Phase II activities, removal of the above ground storage tanks, and the removal of sections of the loading dock at the facility. Phase II of the work plan addressed the installation of a security fence around the perimeter of the property, the removal of a building above a breeze-way, which was found to have contaminated soil, removal of the concrete pads and loading ramp in Area B, and the contaminated soil from Areas B, C, and D (see Figure 1 in Attachment 2).

### **3.0 SITE ACTIVITIES**

The following sections detail the activities conducted at the site during the Phase I and Phase II removal activities.

#### **3.1 PHASE I ACTIVITIES**

On November 12, 2002, START-2 mobilized to perform oversight of contractor and subcontractor activities at the Red Panther site. URS, in Atlanta, Georgia, was the primary contractor for the PRPs. URS retained HEPACO Incorporated, in Memphis, Tennessee, to carry out the planned site work.

Contaminated soils in the drainage ditches 1, 2, 3, and 4 in Area A (see Figure 1 in Attachment 2), to the east side of the site, were removed. The soils from these ditches were analyzed for volatile organic compounds (VOCs), Toxicity Characteristic Leachate Procedure (TCLP) semi-volatile organic compounds, TCLP metals, and TCLP pesticides for waste profiling. The surface-to-one foot level of the soil excavated from

ditch 1, the top two feet of ditches 2 and 3, and the soil from ditch 4 was profiled as nonhazardous waste. These soils were loaded directly into trucks for disposal in the Waste Management, Subtitle D Landfill, located in Robinson, Mississippi. The soils from the one-to-two foot level from ditch 1 were profiled as hazardous waste and were stockpiled inside the concrete berm in Area B to be removed during Phase II activities. During these activities, approximately 825 tons of soil were removed from the site. Due to high levels of arsenic found in drainage ditches 5 and 6, URS recommended that a chain link security fence be installed around the ditches to prevent public access, and the soil removal be addressed in the Phase II work plan.

During this removal activity, URS retained W.L. Burle Engineers, Inc., in Greenville, Mississippi, to conduct soil characterization sampling in Areas B, C, and D. Area B was segregated into 20 grids. A five-point composite surface sample was collected from each grid. Single point aliquots from each composite sample were collected in the event that the analysis from the composite sample indicated that further analysis was required. Two direct push technology (DPT) boring samples were taken in each grid. Each of these soil borings was sampled at the zero-to-two foot, two-to-six foot and six-to-ten foot intervals below ground surface (bgs). These levels were used in determining the vertical extent of the contamination. The grid layout and sample locations are presented in Attachment 1 as "Area B Sampling Locations."

There were five sets of DPT borings taken in Area C. Each of these soil borings was sampled at the zero-to-two foot, two-to-six foot and six-to-ten foot intervals, bgs. These levels were used in determining the vertical extent of the contamination. The sample locations are presented in Attachment 1 as "Area C DPT Locations."

Area D was segregated into 11 grids. A five-point composite surface sample was collected from each grid. Single point aliquots from each composite sample were collected in the event that the analysis from the composite sample indicated that further analysis was required. Two direct push technology (DPT) boring samples were taken in each grid. Each of these soil borings was sampled at the zero-to-two foot, two-to-six foot, and six-to-ten foot intervals, bgs. These levels were used in determining the vertical extent of the contamination. The grid layout and sample locations are presented in Attachment 1 as "Area D Sampling

Locations."

On February 9, 2004, START-2, URS and HEPACO mobilized to the Red Panther site to continue soil characterization sampling, to sample the contents of eight above ground storage tanks (ASTs) located on the west side of Area B, and sample the contents of one AST in Area D. HEPACO gained access to seven of the eight ASTs in Area B and the AST in Area D to sample the contents for waste profiling and determine product levels remaining in the tanks.

### **3.2 PHASE II ACTIVITIES**

On October 4, 2004, START-2, URS and HEPACO mobilized to the Red Panther site to begin the initial removal action associated with the Phase II activities. Removal of the rail spur and parts of the loading dock in Area C, and the decontamination and removal of the ASTs was performed.

During these activities, approximately 700 feet of iron rail were removed from the rail spur in Area C and stockpiled for later disposal. There was 117 tons of concrete removed from the loading dock and shipped to the Waste Management, Subtitle D Landfill, located in Tunica, Mississippi, as construction debris. Some of the concrete from the north end of the loading dock appeared to be contaminated with pesticides. This concrete was segregated to be sampled for waste profiling. The stockpiled soil was profiled as hazardous pesticide waste. There was 59.84 tons of soil shipped to the Waste Management Landfill in Sulphur, Louisiana, for bioremediation treatment.

The ASTs were checked with a lower explosive limit (LEL) meter to determine if there was an explosive atmosphere inside the tanks. When it was determined that the atmosphere inside the tanks was not explosive, HEPACO personnel utilized a plasma cutting torch to cut the ends off the tanks to allow for easier removal of the residual material in the tanks. Once the residual material was removed and placed into a roll-off box, the tanks were vacuumed and triple-rinsed for decontamination. The vacuumed material and rinsate water were stored in a vac-tank until this material could be profiled for proper disposal. The tanks were then cut

into more manageable pieces to be shipped to Martin Brothers Scrap Metal in Clarksdale, Mississippi. A total of 32.64 tons of scrap metal was shipped to Martin Brothers.

There were three roll-off boxes, one vacuum tank and six drums of material generated during these activities. There was 48.43 tons of material in the three roll-off boxes shipped to the Waste Management Landfill in Emelle, Alabama for soil stabilization. A total of 5.39 tons of material in the vacuum tank and the six drums were shipped to the Waste Management Landfill in Emelle, Alabama for incineration.

On April 12, 2005, START-2 mobilized to perform oversight of contractor and subcontractor activities at the Red Panther site. URS, in Atlanta, Georgia, was the primary contractor for the PRPs. URS retained Compass Environmental, Inc. (Compass), in Chicago, Illinois, to carry out the planned site work.

Compass contracted Wright Steel Company, in Clarksdale, Mississippi, to remove the existing fence adjacent to the loading dock in Area C, install a security fence around the perimeter of the property to include closing East Tallahatchie Street, install gutters on the existing buildings on the property to control the effects of rain water on the site, and demolish the metal building above the breeze way between Area C and Area D.

Compass retained Evans Engineering, in Clarksdale, Mississippi, to survey the site prior to any excavations, to layout the sample grids in each Area, survey the sample locations in each grid (see Figure 2 in Attachment 2), survey the area elevations after excavations were complete, and perform compaction testing on backfill operations. Evans Engineering also surveyed the site at the completion of the restoration activities to provide as-built elevations for the PRPs.

On April 15, 2005, Compass began the demolition of the concrete pads in Area B, and the concrete ramps in Areas B and D. The majority of this material was profiled as nonhazardous waste and was shipped to the Waste Management, Subtitle D Landfill, located in Tunica, Mississippi, as construction debris. There was a total of 1,187.82 tons of nonhazardous concrete removed from the site during the Phase II removal activities. An additional 32.15 tons of hazardous concrete was shipped to the Waste Management Landfill

in Emelle, Alabama. This hazardous concrete was a combination of concrete from the loading dock, segregated during previous site activities, and concrete from the pads in Area B.

On April 28, 2005, Compass began excavations in Areas C and D to remove nonhazardous soils to be shipped to the Waste Management, Subtitle D Landfill, located in Tunica, Mississippi. Excavation of Area B began on May 3, 2005. High pesticide levels in soils from Area C required these materials to be shipped to the Waste Management Landfill, in Port Arthur, Texas, for bioremediation. High arsenic and pesticide levels in soils from Area B required these materials be shipped to the Waste Management Landfill, in Emelle, Alabama, for incineration for the pesticides followed by soil stabilization for the arsenic. Ditch 5 and ditch 6 were incorporated into Area B due to the high levels of arsenic contamination present. The material from this area was also shipped to the Waste Management Landfill, in Emelle, Alabama, for soil stabilization. A total of 15,035.38 tons of nonhazardous soil, 5,574.27 tons of hazardous arsenic soil, 1,133.76 tons of hazardous pesticide soil, and 777.64 tons of hazardous pesticide and arsenic soil were removed from the site during these Phase II activities (Ref. 8).

On June 29, 2005, Compass completed excavation of the site. The EPA, On Scene Coordinator, Steve Spurlin indicated that START-2 would not need to remain to perform oversight of the contractors' activities during backfill operations. On July 5, 2005, START-2 demobilized from the site. Copies of the logbook notes are presented as Appendix B, and a photographic log of the site activities is presented as Appendix C.

#### **4.0 ANALYTICAL SUMMARY**

Due to the number of samples needing to be analyzed during the Phase II activities, URS retained Environmental Chemistry Consulting Services, Incorporated, in Madison, Wisconsin, to set up a mobile lab at the site. This facilitated a 24-hour turnaround time for results of the grid sample analyses. Each sixty-foot by sixty-foot grid would have a four-point composite confirmation sample taken (see Figure 3 in Attachment 2). A sample of the four individual aliquots for each grid was stored. If the grid sample exceeded the performance standards set forth in the AOC, the individual aliquots were analyzed to determine which parts

of the grid failed the performance standard. Once the analysis was complete, URS and NewFields could determine which parts of the grid needed to be excavated further in order to meet the performance standards.

Duplicate samples were analyzed for every one-in-ten grid samples taken for quality control purposes. In addition to the duplicate samples analyzed on-site, split samples of every one-in-ten grid samples was sent to an off-site independent lab for analysis. If the off-site analysis varied by more than 35%, the higher of the two values would be used in the data review. The highest levels encountered were 1,700 ppm of arsenic, in Area B, 22,000 ppm of toxaphene in Area C, and 7,000 ppm of dieldrin, also in Area C.

NewFields tracked the analytical data using "Domain Averaging" to determine if the data provided met the performance criteria. Using this system of data analysis, the values from all the grids in an Area were added together and then "averaged" over the "domain" of that area. This allowed some of the grids to exceed the performance standards while the majority of the grids were well below the performance standards. Hot spot criteria were developed to determine how far over the performance standards a grid was allowed to be without adversely affecting the rest of the domain. NewFields developed a confirmation sampling decision tree to standardize the decision procedure (see Figure 4 in Attachment 2). A summary of the grid performance (pass/fail), excavation depths, and the actions taken, is presented as Tables 1 through 4 in Appendix A

## 5.0 CONCLUSIONS

There are two types of arsenic compounds, organic and inorganic. Organic arsenic compounds were typically used as wood preservatives. Inorganic arsenic compounds were used in insecticides and are the types of compounds found to contaminate the Red Panther Chemical site. While some of these arsenic compounds are soluble in water, the removal of contaminated soil at this site should prevent any direct human contact with this contaminant, and significantly reduce the possibility of it migrating to the surrounding environment.

Toxaphene is an insecticide that used widely in the southern United States until 1982, when it was banned from most types of use. All use of this insecticide was banned in 1990. It can be found as a gas or a solid. The solid form was found to contaminate the soil at Red Panther. While it is not readily soluble in water, if exposed to the air, it will evaporate. The removal of the contaminated soil to more than two feet bgs, and the subsequent backfilling with clean soil, should prevent any direct human contact with this contaminant, and significantly reduce the possibility of it migrating to the surrounding environment.

Used extensively as an insecticide from the 1950's to the 1970's, dieldrin was banned from use except for termite control. All forms of its use were banned in 1974. Dieldrin is a breakdown byproduct of aldrin. It does not readily dissolve in water (Ref. 9). Its primary avenue of migration to the environment is evaporation. The removal of the contaminated soil to more than two feet bgs, and the subsequent backfilling with clean soil, should prevent any direct human contact with this contaminant, and significantly reduce the possibility of it migrating to the surrounding environment.

The existing buildings on the site were not considered an environmental threat to the community, and were left in place. A comprehensive summary of the analytical data and the actions taken by the PRP group under the AOC can be found in the Phase II Soil Removal Report currently being reviewed by the EPA (Ref.10).

The EPA Site Evaluation program plans to conduct a Reassessment at the Red Panther Superfund Site. EPA will utilize the data generated from the 18th Street investigation and the Red Panther Superfund removal action to conduct an analysis of potential long term threat to human health and the environment.

1700 - VR on site along with  
 Hepaco & myself. Rainning  
 steadily, will open ditch  
 in section 1 and drain Run  
 water. Section 4 & 5 are  
 not complete and it appears  
 they will not work today because  
 of the rain + water saturation.  
 Hepaco called 1500 gallon  
 plastic tank to use for  
 holding water from the ditch.

1800 everyone left site for the  
 day.

J.C.

12

14

Location Clarkdale Minn. Date 11/19/02Project / Client Dick CarlsonTuesday 58° - high today 62° 61°1145 On site - Traveled todayStart 6:00 5AM.Hiparco pumped (11/18/02)~~water~~ from the ditch

in Section 45 and put it into

a holding tank. Volume

was to great so they stopped

after filling one 1500 gal

plastic tank. Estimate were

30 to 39,000 gal of water in the

ditch.

Monday they resumed work

11:30 on the culvert. It

had rained again on

Sunday night so water

is marked a problem in the

ditches.

@ 11am on Tuesday they struck  
another water line in the  
center of Patton street,  
at the intersection of paths  
and Normandy. The utility  
company informed us by

15

7

Location Clarkdale Minn Date 11/19/02Project Clarkdale MinnWater Mainmon but not before the ditch  
was again filled with water12:30 PM - Hiparco & Sons returned  
from Laramie and continued  
to replace the culvert across  
pattern. The utility company  
will run the water line over  
the culvert.1:30 Utility Dept. on site to open  
water line. Hiparco backfilling  
culvert across pattern.Surveyors on site to begin survey of  
culvert location in 10 after 11 to 3:45.Surveyor W.M. Baile of Clarkdale.  
3:00 Bert Col indicated that  
the analytical from the Bowman  
jet showed 4.2 ppm Nitrate.The std is 5. He suggested  
that appeal to use little material  
be called Roland Jones and  
that a message - side channel  
be called 10:25 and indicated  
that it was O.K. to use.

17

Location Clarksdale Miss Date 11/27/02

Project / Client Wednesday - 70° 45° Clear  
High today 45° Clear

- 0700 URS + Hepaco on site  
 limestone delivered - will use  
 to complete coverage of culverts.
- 0715 Tonbridge meeting URS Hepaco  
 load out soils for disposal  
 that were taken from culvert  
 replacement areas.
- 0800 Del small concrete culvert  
 in Ditch 2 on Patten Street.  
 Surveyors on site to do survey  
 of sample locations in ditch. 1-2-3-4-5
- 0830 Analyticals are back for ditch 2  
 only - it failed bioassay & Deltabur  
 tests - Blid need to coverage all  
 ditch, and there is no data on  
 other ditch yet. URS will need  
 to stop work if analyticals are  
 not back yet.
- 1045 A review of the source preliminary  
 analytical on ditch 1 & 2 indicates  
 the ditch is a high potential  
 for the source area to be the  
 leading area on the property site  
 behind the law office building.

- 1500 One truck of hay soils moved off site.  
 1510 Fence was almost complete decision on placing gate at Normandy end of fence. There is a gate on the Gable side that will allow access.  
 1530 Second truck loaded pumping water into frac tank from Normandy end of Dutch 12  
 1600 T.C. Depaired Site

23

Location: Clarkdale Miss Date: 12/3/02  
 Project Client: Red Panther Tuesday -  $T = 41^{\circ}$  Overcast Cold

- 1045 Arrived on site and discussed URS activities with Slave Sister. URS was on site Monday and advanced several DPT boring to determine depth to water. No pipe placed in hole and estimated ranged from 5' to 9' BSW WL BORIE is the subcontractor handling the DPT and two (2) borings had already been advanced today outside the fence in the Gable project. Lithology is silty sand to 3' grading to silty clay to clay at 10'. Sample was taken at 2' intervals and will be sent to the lab for analysis.

A review of the work completed on the ditch indicates that the ditch 1-2-3-4 & 5 were backfilled and graded.

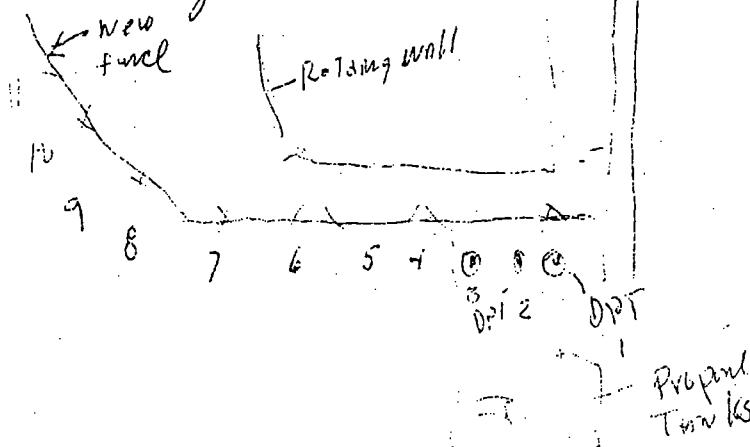

24

Location Clarkdale Mine Date 12/3/02  
 Project / Client Paul Danher

Tuesday

A red expandable plastic fencing was laid in depths 1+2' from to backfilling to delineate the excavation depth. Backfill was placed on top of that fence so that should further excavation be needed the plastic fencing would define the level at which excavation needed to begin.

- 1200 URS & BURKE crews break for lunch.  
 1300 URS & BURKE crews return + began to advance DPT #3 ~

25

Location Clarkdale Mine Date 12/03/02  
 Project / Client Paul Danher

Tuesday

1530 - Continue to advance DPT's + collect samples  
 Borehole probe over missed rebar. Wall to define extent of concrete cover. May have found Syntic. URS decided to get a backhoe blade to assist in taking samples. Stone + gravel area to hard to dig in. DPT will not go through that stuff.

BG Guds are to be laid out for sampling. BURKE engineering has provided a grid survey map of the areas to be sampled. (syntic area)

- 1600 - DPT sampling continues @ dpt 7+8 a layer of soil white in color appears at 2' depth and is about 6" thick. URS below this is the area where high Acinic was detected earlier in characteristics. The groundwater in this area appears to be @ 3' BGS or less. Most likely a perched area.

- 0730 - On site - No one is here?  
 0745 - Burle engineering personnel showed up on site to set up equipment.  
 0815 URS are here apparently they were in the office building preparing their equipment.  
 0900 I observed the DPT operation on ~~Tuesday~~ 11-3 and the borings advanced ~~in~~ + on the Grable site wells 1 through 6 or so seemed to hit water at 5'. The borings were advanced through 10' and were very wet. In some cases water was forced out of the DPT tubes taken from 6' depth. This may well cause cross contamination of samples as the DPT are usually taken in 4' increments + it took 36 complete a 10' hole.  
 I feel the sample taken below 15' are suspect. JG.

29

Location Clarksville Miss Date 12/11/02  
 Project / Client Red Panther T° = 42' Forecast  
Wednesday -

6730 - VRS & BURLE on site Hepaco.  
 as well.

0900 - Begin DPi - Sampling in  
 DG Area.

Hepaco has a few small surface  
 holes to dig. They are awaiting arrival  
 of tank to remove water from 2000  
 ton tank resting in area B6-. Water  
 is contaminated and will be moved by  
 Excel of memphis.

0915 - Core driller drilled concrete in  
 B6 area for Surface & DP Samples -  
 B6 area produced the yellow  
 cutting indicative of concrete  
 possibly contaminated with some type of  
 pesticide. The water lay in  
 depression areas near the drilling  
 point. This obvious contamination  
 will be left on the surface to  
 dry. I recommend that no one  
 drive over the area -

 Project / Client Red Panther

- 0630 - Depart hotel for site.
- 0710 - Arrive onsite, begin to find office and read note that Tim left. START-2 (Rowland) onsite for the next 3 weeks.
- Rowland signs HASP and begins to read over NewFields' final design work plan.
- 0830 - Wright Steel continuing to work on gutters and perimeter fence. Compass continued to remove the R/R ties.
- 1000 - Break for lunch.
- 1100 - Back from lunch.
- 1300 - Rowland takes a ride with Dave Delaney from URS to go around the site. Rowland takes two photos.
- 1700 - Depart site for the day.

*Jeanne L. Rowland*

end of Day

95

Location Clarksdale, MS Date 04/26/05  
 Project / Client Red Panther

- 0700 - START-2 (Rowland) departs hotel for site.
- 0745 - Rowland arrives onsite. Rain for Rent has arrived onsite to hookup filters to frac tanks. Rowland was informed that there will be 2 trucks running today back & forth to Tunica disposing of the concrete.
- 1000 - Two (2) trucks arrived onsite for the concrete, will come back for two(2) more loads after the 1st two(2) are disposed.
- 1200 - Lunch break.
- 1230 - Back from lunch break.
- 1600 - Rowland discusses the need for her to get a copy of those manifests so that Rowland could put them into a spreadsheet, or at least put them in the log book. URS(Delaney) signed the manifests. Will get weights tomorrow, along with a copy of the manifests.
- 1700 - End of Day

96

Location Clarksdale, MS Date 04/27/05  
 Project / Client Red Panther

0700 - STAER-2 (ROWLAND) depart hotel  
 for site.

0745 - Rowland arrives onsite.

0815 - Compass Environmental informs  
 Rowland that they will be disposing  
 of more concrete today. Two trucks  
 have been loaded out so far.

0915 - Compass Environmental gives Rowland a  
 copy of yesterday's ton total will  
 file in drawer. Compass said they  
 will give us a copy everyday.

1000 - Brent Jacobs (URS) arrives onsite.

1045 - Delaney gives Rowland a copy of  
 the spreadsheet info he has collected  
 from yesterday. Rowland put info into a spread

1230 - Break for lunch.

1330 - Lunch break is over.

1445 - Rowland takes a site walk and takes  
 photos.

1530 - Rowland re-reads the Newfields project  
 work plan.

1630 - Brent Jacobs comes by and says that  
 he just got off the phone with  
 Steve Spurrier (EPA) about the

97

Location Clarksdale, MS Date 04/27/05  
 Project / Client Red Panther

confirmation sample standards &  
 that everything turned out to be  
 O.K.: as far as the standards  
 with the exception of the  
 to xaphene standard, in which  
 Brent was going to tell the  
 lab to fat or email Denise  
 their lab info. Brent then  
 invites Rowland into the  
 meeting with him, the URS,  
 Compass, & the Lab guys.

During this meeting they discuss  
 the following things:

- Which area Compass may want  
 to start digging in.  
 (Pros & Cons) of each way  
 to do it. Having the trucks come  
 in on SHSSE St. is an option.  
 Compass would like to dig along the  
 way of AREA C but would like  
 to leave the road in along C.  
 So they will talk to Steve about  
 leaving that in. They also  
 mentioned going ahead and trying

98

Location Clarksdale, MS Date 04/27/05  
 Project / Client Red Panther

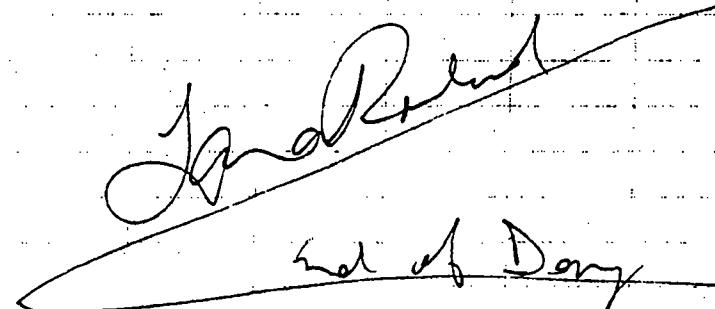

to get a sample from the C5 and on down for a profile to be made. So that they will know how deep they have to go on C8.

- Also they talked about the bracing of the gasoline near the C2 near the building. Gas people said that the line needs to be braced every 25'. Compass had thought about digging it out along both sides of the pipe, but if it rained the soil would give way.

- Tomorrow's meeting will begin @ 11am.
- Also, Compass hopes to begin hauling non-haz. soil, tomorrow.

1730 - Meeting adjourned.

1800 - Rowland departs site for hotel.

John Rowland  
End of Day

99

Location Clarksdale, MS Date 04/29/05  
 Project / Client Red Panther

0730 - Stet - 2 (Rowland) departs hotel for site.  
 0815 - Rowland arrives onsite and goes for a site walk to see what areas they are excavating & where have started on the area of C7 & C8 & Area D, with the 2' foot excavation, and are loading trucks, with non-hazardous soil, & continue on the concrete (non-haz).  
 1000 - The two (2) representatives from NEWFIELDS arrive onsite.

1030 - OSC (Spurin) arrives onsite  
 Rowland & Spurin sit and talk about any concerns or questions that she has about the site, and they discuss something that Brent Jacobs (URS) said that he saw onsite that he didn't like and Rowland in return pointed some things out to Brent. And the list is as follows:

1. Barb wire along the top part of fence, to be fixed by Wright Steel and also they need to fix

100

Location Clarksdale, MS  
Project / Client Red Panther

Date 04/28/05

- the gutters.
2. No smoking in Hot Zone! Excavation area and in Building.
  3. Tarping the trucks
  4. Deconning trucks that leave the site.
  5. Expanding the "Caution" tape around the site to keep the cotton trucks from exiting the site, along Sasse St. <sup>more</sup>
  6. Hanging up keep out signs.
  7. Set up perimeter monitoring stations
- 1100 - Meeting with USEPA, Weston, URS, NEWFIELDS, and ECCS.

The following were discussed:

1. Each individual aliquot will be held by the onsite lab in case one of the composite samples come back high, each individual aliquot is analyzed.
  2. Each Grid is 60 x 60
    - ~ Broken into (4) - 30 x 30 aliquots
  3. Grid composite sample should be 34 hr. turnaround.
- \* Still need to decide when to run MS/MSD, equipment blanks

Location

Clarksdale, MS  
Project / Client Red PantherDate 04/28/05<sup>101</sup>

4. Data will be given in Excel format, COC (.pdf).
5. There will be a May 12<sup>th</sup> meeting between NEWFIELDS & PRP and they will explain to the PRP's of the possible financial increase if Compass has to dig deeper.
6. Q: How many grids may be opened at one time?  
A: There maybe four (4) grids open at one time instead eight (8). The grids are (60 x 60).
7. Q: What happens if you get to the end of the digging of an area and it blows your Performance Standards?  
A: The Performance Standards will have to be adjusted accordingly because it must meet the overall average for the grids.
8. If you had 15 N D ad / Hot Spot (1500) then your overall average is OK but if you had another one above 1500 then you would have to dig that up

102

Location Clarkdale, MS Date 04/28/05  
 Project / Client Red Panther

9. Monitor the excavation of grids to correct depth, make sure it goes to correct DF.
10. If there is visible contamination
  - Newfields would like for it to be sampled
  - Steve indicated that he would like for us not worry about the usual until we either get to the vertical depth of 2' - 4' - 10'.
11. 0-2' will be analyzed for Total Chlorinated Pesticides  
~~depth~~ Any depth greater than 2' is considered Subsurface soils.
12. Surface samples will be analyzed on a point by point analysis
13. Tokayphene standard & calibration data to Denise in Athens by onsite ETC & ECCS.
14. Steve said that Mike (Compass Environmental) could come 3ft. off curb and a left berm for the gas line

Location Clarksdale, MS Date 04/28/05<sup>103</sup>  
 Project / Client Red Panther

15. Mike (CE) said that per Kite Management that Mississippi does not have to have tarps on their trucks.
16. There are now 14 air monitoring points twice a day. Steve wants 3 of these stations to be monitored with mini-rain on an 8hr interval. URS will take care of the monitoring.
17. Will cover excavation with plastic while open.
- 1230 - Meeting adjourned.
- 1330 - Rowland, Spurlock, Job Jacobs, Delaney, walk around site.
- 1530 - Spurlock departs site.
- Spurlock informs Rowland that he would like for START-2 to do a POLREP at least once a month, also that he wants START-2 to take pictures of new developments

104

Location Clarksdale, MS Date 04/28/05  
 Project / Client Red Panther

you don't have to take pictures everyday, watch the contractors make sure they don't get too relaxed.

1730 - Rowland departs for hotel.

*John Rowland*

04/28/05

Location Clarksdale, MS Date 04/29/05<sup>105</sup>  
 Project / Client Red Panther

0715 - START-2 (Rowland) departs hotel for site.  
 0800 - START-2 (Rowland) arrives onsite, begins look at the loading ~~beginning~~ being done onsite. Then starts logging notes into log book and on spreadsheet.

1000 - Rowland sends a sample POLREP request to Tim Maher.

1100 - Tim sends a copy of one back.

1630 - Rowland offsite, to depart to hotel.  
 \* Steve Sparlin did not come by the site today.

*John Rowland*

End of Day

106

Location Clarksdale, MS. Date 05/02/05  
 Project / Client Red Panther

- 0815- START-2 (Rowland) arrives onsite.  
 0845- Rowland takes a site walk through and takes pictures.  
 0900 - Site walk through is complete.  
 ~Wright Steel is onsite to put barb wire on top of fence.  
 1030- Brent Jacobs (URS) onsite, begins onsite air monitoring.  
 1130 - URS' air monitoring van has arrived onsite.  
 1300 - URS onsite monitoring did not have any high reading < 002.  
 1500 - Onsite perimeter was evaluated twice today.  
 1645 1745 - Compass loaded out 10 trucks today w/ non-haz soil, debris and concrete.  
 1800- Rowland departs for hotel.

End of Day

107

Location Clarksdale, MS Date 05/03/05  
 Project / Client Red Panther

- 0730- START-2 (Rowland) arrives onsite.  
 0815- Rowland arrives at the site. Rowland takes a site walk through.  
 ~ Wright Steel is working to complete the barb wire along the tops of the fence, and working to complete the gathering system.  
 ~ Company is continuing to load the trucks with non-haz soil.  
 1000- Compass began excavating the (0-2') in the D6, D5, B5 & B6 areas. Compass hit a water in the D6 excavation area. CPU came out to shut off water. Compass pumped the water to the fire truck.  
 URS began measuring off the sample grid points in the 'D' Area.

108

Location Clarksdale, MS Date 05/03/05  
 Project / Client Red Panther

URS began air monitoring at selected monitoring stations. None of the stations reported an elevated reading.

1300 - 1330 Lunch break

1500 - The entrance exit driveway along Tallahatchie Avenue in the B5 Area collapsed, so Compass will be forced to have the trucks enter through the entrance along Norwinsky Ave.

1700 - Begin fixing the water line

+86 1830 Water line fixing is

1900 Complete.

1800 - Rowland offsite headed to hotel.

*I am glad*  
*End of Day*

Location Clarksdale, MS Date 05/04/05<sup>109</sup>  
 Project / Client Red Panther

0730 - Rowlands departs hotel.

0815 - Rowland onsite.

~Wright Steel are onsite completing gutters & dismantling the building over the breeze way.

~Compass is continuing loading with non-hazardous soil.

1030 - URS sampled grids D12 & D13. URS, also, will sample all of the grids with Type II soil to be sent to the offsite lab.

1300 - Lunch break.

1320 - Lunch break over.

Compass' excavator got stuck in the mud. URS received results that were high for D12 grid.

1700 - Compass still onsite completing digging seadago. Rowlands has just received data. Will input data.

1800 - Rowland departs site for hotel.

*I am glad*  
*End of Day*

110

Location Clarksdale, MS Date 05/05/05  
 Project / Client Red Panther

- 0730 - Rowland departs hotel for site.
- 0815 - Rowland arrived onsite. Rowland then begins a site walk through.
  - Compass is excavating the non-haz soil of B11, & B10, & B16
  - ~ 2 heads of hazardous concrete were shipped offsite to Emelle
  - ~ 1 load of arsenic mixed soil was shipped to /
  - Wright Stell is still dismantling breezeway.
- 1300 - Rowland creates logbook.
- 1430 - Brent Jacobs (URS) departs site, will return on Tuesday.  
 Rowland continues to enter data into spreadsheet.
- 1400 - Rowland departs site for hotel.

*Jeanne Rowland*

End of Day

111  
 Location Clarksdale, MS Date 05/05/05  
 Project / Client Red Panther

- 0700 - Rowland departs hotel for site.
- 0745 - Rowland arrived onsite.  
 ~ Compass Environmental began excavating the HAZ area along the B1 & B2 area (along the concrete divider) then excavation plans call to pull up the concrete and Compass also excavated the top some more of C Area along Tallahatchie Ave.
- 0930 - Wright Stell is onsite to continue dismantling the building over the breezeway.
- 1200 - Break for lunch.
- 1230 - Back from lunch.
  - ~ Receive email from Brent (URS) about the Aliquot results from D-12. The results show that Aliquots D-12 C & D-12 D have a high contamination result.

*JCR*

112

Location Clarksdale Date 05/06/05  
 Project / Client Red Panther

1345 ~ Receive an email from Charlene Rivard (NewPTE) replies that the ave. values of all (4) 30-ft grids in grid 12 continue to cause the 954CL to exceed the performance standards.

Sampling grids C & D will have to be excavated an add'l foot to make sure we have excavated all of the contamination.

1600 - Carter responded by saying please proceed with 1' of add'l excavation in quadrants 10C & 12D of grid D-12. These quadrants are above the max allowable hot spot criteria; in addition they cause a CS failure.

1700 - Depart site for hotel, to finish daily report.

1745 - Arrive at hotel.

1830 - Rowland has completed report.

Location Clarksdale, MS Date 05/09/05  
 Project / Client Red Panther

0730 - Rowland arrives onsite.  
 ~ Compass is excavating the rest of unexcavated area in D12 & D11 near the building.  
 ~ Wright Steel has completed the the dismantling of the building over the doorway. They are now removing the metalation and siding and loading it.

~ Rowland takes site walk.  
 There is a stockpile of Soil in the B Area along with a stockpile of concrete.

~ Compass is completing cleaning & loading out of soil along Area C.

1000 - Rowlands begins to enter data into spreadsheet.

1200 - Compass has excavated the left excavation of Grid 12.

1300 - Rowland takes a break.

1400 - Rowland lunch break is over.

1830 - Rowlands departs the site.

-JAN

114

Location Clarksdale, MS Date 05/10/05  
 Project / Client Red Panther

0800 - START - 2 (downwind) onsite.

~ Compass is leading has 2 non-haz soils. Only 2 trucks for haz can go out at a time, but the trucking company has sent (4). The other (2) will spend the night at a local hotel.

~ Compass is excavating soil in "B" Areas.

~ Wright Steel is removing the installation & siding from the building.

~ Compass still has two stockpiles white 1 = haz soil 1 = non-concrete

1000 - Project Manager for Compass arrived onsite (URS)

1100 - Michel arrives onsite, he will collect samples from the J-1d C & D-12 D grids.

1200 - Break for lunch.

1230 - Back from lunch.

1400 - Compass & URS have conference about excavation.

End of Page

115

Location Clarksdale, MS Date 05/10/05  
 Project / Client Red Panther

1630 - URS has collected samples.

\* Compass had the Survey crew onsite to survey the "D" Area.

1830 - LOWLAND departs site for hotel.

End of Day

116

Location Clarksdale, MS Date 05/11/05  
 Project / Client Red Panther

0800 - Rowland arrives onsite.

Talked to Mich and he said that he sampled D6 Grid Composite & D5 Grid Composite yesterday. Along with 12D & 12C resamples. Are awaiting results for all. Will start sampling the C & B Areas.

1128 - Received the results from DG5-12C & DG5-12D & DGC-5. Warner decided that to go one foot deeper 12D & DGC-5. Michel (URS) has taken the samples.

200 - Rowland (START 2) breaker for lunch.

245 - Rowland back onsite.

400 - Rowland was informed that the PRP61 will be onsite tomorrow. Also after grid 5D was excavated an extra foot (URS) noted the shell that could possibly be still contaminated, so URS decided to a TCLP sample of the soil before they load it out because as of right now it is labeled "non-haz".

Location Clarksdale, MS Date 05/11/05<sup>117</sup>  
 Project / Client Red Panther

but they are not sure because of the same and how bad the sample had failed before.

There will be a meeting with the PRPs & URS tomorrow.

1738 - Rowland off site.

*Rowland*  
*Day 2*  
*End of Day*

118

Location Clarksdale, MS Date 05/12/05  
 Project / Client Red Panther

0730 - START-2 (Raw and ammonia units)

~ Compass is in the process of loading the following trucks.

-3 Trucks are going to Emelle

-2 Trucks are going to Onyx

-4 non-haz trucks

-1 concrete

~ URS took a TCP sample on the 5D soil because of the odor and b/c it failed. Compass has stock pile all of this soil.

~ Compass has done general site housekeeping around the site.

After the (4) non-haz trucks had been loaded, Compass didn't have any more non-haz soil on site, at the moment.

1030 - Brent Jacobs (URS) arrived onsite.

1100 - Everybody began to arrive for the meeting with P.R.P.s.

1320 - Back for lunch break.

1330 - Back from lunch break. Compass did air monitoring in the B area where the reddish-

119

Location Clarksdale, MS Date 05/12/05  
 Project / Client Red Panther

purple streaks were found in the soil. Compass determined that a respirator needed to be worn while excavation is ongoing.

1700 - Depart site for hotel.

17

06/13/05

0900 - START-2 (ROWLAND) ARRIVE.

~ Begin printing the results and reviewing recent activities.

1000 - ROWLAND OUT ON SITE NOTING THAT THERE APPEARS TO BE NO DECOR AREA ON THE SOUTH SIDE OF SITE. THERE IS DUST.

SUPPRESSION ONGOING COMPASS NEEDS TO MAKE CERTAIN:

1. Every truck departing the site gets deconned.

2. Know exactly where to excavate and not guess where to start & how deep to go.

1100 - COMPASS BEGAN TO EXCAVATE THE AREA IN "C" TO APPROX. 4 FT. FROM (2-4) FT. SOIL IS GOING TO TURNED.

1210 - BREAK FOR LUNCH.

1310 - LUNCH BREAK COMPLETE.

1325 - COMPASS IS CONTINUING TO EXCAVATE THE AREA "C" IN "B".

1435 - THE LAST NON-HAY TRUCK

(Mon) 06/13/05

arrives onsite to pick up soil from Area "C". Mike Vails (Compass) informed his crew that they can get off work once the loading of this last truck is complete.

1510 - Compass begins to depart the site.

Rowlands continues to work on daily.

1600 - Dave Delaney (URP) comes by the office and asks has everyone left for the day & Rowland replies "yes" & Delaney asks well how is Rowlands gonna lock the door & Rowlands states that Mike Vails (Compass) showed her where the security guard keys were & he said that I didn't have to stay until the security guard got there that I could leave whenever I got ready, it would be "OK to leave the door unlocked." Rowlands informed Delaney of such and his response was "what kind of sense does that

06/13/05 (Mon)<sup>19</sup>

make and Rowlands replied "I am just telling you what Mike told me if you can call him and ask him" Delaney response was "what kind of sense does that make.. Rowland's response was "I am just telling you what they told me". Delaney response was "Well pack shit & let's go". Rowland didn't think that that kind of language was appropriate but just decided to it let's go. So Rowlands went to the room and decided to try to complete some work.

<sup>1615</sup>  
1630 Rowlands departs site for hotel.  
1635 - Rowlands arrives at hotel. Begins to work on daily.  
1730 - work completed will finish tomorrow.

*John Rowland*  
end of Day

(Tues. 06/14/05)

0815 - START - 2 (Rowlands) arrives on site.

Compass is excavating soil in area "C" 5' x 8'

0845 - Hertz arrives to put the straight edge metal plate on the end of the excavator.

Welding

1020 - Hertz has completed the welding of the straight to the excavator.

1000 - Compass began excavating BII. Loading out for waste disposal in Timica.

Area "C" 4 - 4 ft Grid 2 - 4 ft

While out the compass began excavating one foot off BII.

11:00 - Brent Jacobs (was) & Warner Golden (NEWFIELDS) arrive at the site. Brent informs Rowlands that the lab needed a part that won't be here until tomorrow for arsenic analysis.

1215 - Rowlands takes lunch break.

1315 - lunch break over.

1330 - Compass is still watering down the roads, & loading out area "C".

21  
Tues. 06/14/05

1440 - Brent Jacobs (4x) began sampling Grid D2. Brent said they should be sending results out sometime today. Brent also indicated that he will be sampling C7 - C4 today. Brent remains hopeful that he will be able to get a back fill request for C2, D this week & maybe B the next. Brent & David indicated that there was no tank between D2 & D4. Brent indicated that he had received ~~for~~ the water sample collected last week.

1515 - Compass has departed the site.

1530 - Brent collects the sample from area "C".

1730 - Depart Site

*Joe Rowland*

*End of Day*

Wed. 06/15/05

0800 - Rowland arrives onsite.

Compass is excavating the rest of C4 grids  
is loading the soil from stockpile B.

0915 - The PRPs begin to arrive for a  
- onsite meeting with USGS & Newfield.

1100 Compass has reduced their work  
force by 1 person, so currently they  
have 4 field people.

Compass is now excavating GRID 18/4  
Alignments: 14B & 14C.

Compass was also able to find  
a company to take the soil from  
the "D" stockpile going to Port  
Arthur, TX. The trucking company  
is called STRANCO.

UPS (DD) sampled Grid 4/C.

1230 - Rowland breaks for lunch PRP meeting over.

1330 - Lunch break complete.

Compass is excavating Grid 15B, dust  
suppose to suppression, marking grids  
edges off.

1500 - Compass off site.

1700 - START-2 Rowland off site.

*Jeanne Rowland*  
not of Day

(Thurs. 06/16/05)<sup>83</sup>

0830 - START-2 onsite.

Compass is loading trucks with soil  
going to Emelle, AL & Tunica, MS.  
CLARKE CLARKdale Public Utilities is onsite  
to fix a water line that was broken  
yesterday afternoon. Only a little water  
got out.

0900 - Compass is rearranging stockpile in  
Area "B", refueling an excavator.

0915 - Compass is now continuing to excavate  
B15.

0930 - Both excavators are now excavating  
grids in the "B" Area.

1100 - Compass is still excavating the grids  
in the "B" Area.

Took pictures of white arsenic stuff  
6ft cut in Area "B".

0114 Materials Transport

0114 White material (began removal)

91A - 88A 12A E 12B

B3 - Sampled this week <sup>next</sup>.

1245 - Break for lunch.

1315 - Lunch break over.

Compass is continuing excavate B15.

24

(Thurs.) 06/16/05

1340 - URS arrives to collect samples from  
 B4½(B 8-PA B-12 & B  
 \* B-11 & B-14 - will fail (soil looks)  
 Still to sample B-3 & B-15.

Compass has stockpiled all the visual arsenic contamination in Area "B". URS (DD) is suppose to check behind Compass to make sure all of visual is gone. There is one small stockpile of soil that has a green tint to it, that Compass & URS have noted to be Tokaphene. This soil will be transported from Area "D" to Area "D" steady, etc.  
 This pile really smells.

1400 - URS have collected the samples into the books & will now go to the office to mix them up. Brent Jacobs says that he will be leaving this afternoon to return on Friday Monday. BJ said that the results should be back on Friday.

1452 - URS received the results for B-11 B-14 still for Arsenic.

1500 ~~URS began~~ Compass began

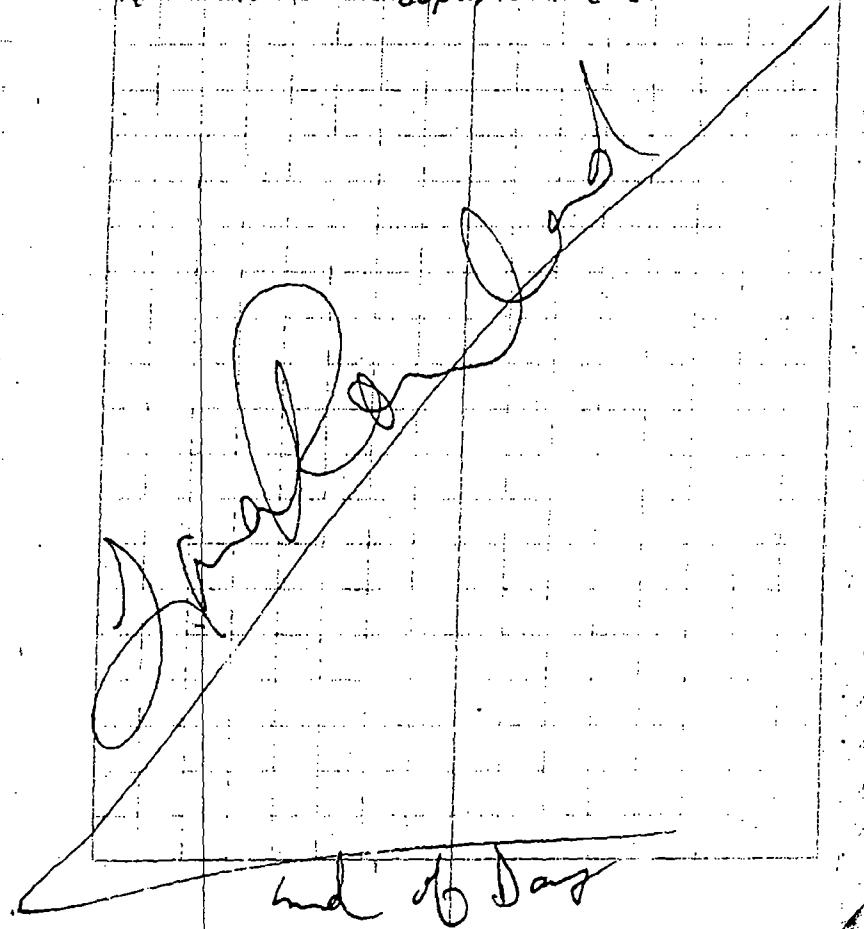

25

06/16/05

departing the site.

1545 - Compass had (2) workers onsite to wait on one of the trucks to load out for Port Arthur, TX.

1630 - Rowlands departs the site.

*end of Day*

26

(FRI. 06/17/05)

0800 - START-2 (Rowland) onsite.

Compass is in the process loading trucks of soil from B15.

0930 - Compass takes the greenish-gold colored soil from "B" to "D" stockpile.

- Compass is taking the smaller excavator to the decon pad to decon it b/c Hertz is suppose to pick it up today.

- Compass is trying repair a door on the building next to Area "D". <sup>per</sup>

1020 - Two (2) trucks arrive to load soils to be transported to Port Arthur, TX. <sup>per</sup>

1100 - Compass comes back to work on the door. <sup>per</sup>

1200 - Rain sprinkles begin to fall.

- BB is sent home today because Compass don't have much work to do, most of the excavation is complete.

1400 - 2 ~~more~~<sup>per</sup> members of Compass staff depart the site.

1500 - Compass & Weston depart site. Rowland heads to hotel to finish

27

(FRI. 06/17/05)

daily report & send out email.

1600 - Rowland completes report & sends out email.

end of Day

(06/20/05 Monday)

0800 - START-2 (ROWLAND) on site:

- Compass loading trucks and are in the process of backfilling Area "C"
  - The 200LC has been cleaned and is awaiting pick up.
  - Compass has repaired the door on the bldg.
  - One of the trucks going to Port Arthur was too heavy, so the driver had to turn back around to off load some of the soil.
  - Backfill is being dumped in "C"
  - Ben Rodgers is now doing manifests & Russ will be using the dozer to push the back fill in. Mike Vails is doing it temporarily.
  - Compass is excavating a foot off of B11 + B14
  - Backfill trucks appear to be coming every 20 mins, 2 truck at a time
- 0930 - Russ is now back filling.  
Dust suppression begins.
- 1030 - Brent Jacobs arrives, Warren Golden arrives @ 20 mins.

(06/20/05 Monday)

before hand

- 1130 - Brent Jacobs, WG, DD, & TR head out the area "B" to collect samples from B-1S, surface sample from triangle soil near B/S, awaiting to collect sample from B11, & still need to clean up B3 more before it is ready to sample.

1300 - Breaks for lunch.

1400 - Lunch break over.

- 1445 - BJ, E, WG measure ditch in front of Admin building.

- 1500 - Compass is loading trucks for Enelle & Tunica (next) & backfilling in Area C B11 & B14 (debris, plastic)

- 1730 - Compass departs the site.

- 1830 - Received results from Lab about Grid B11 & B15.

- 1900 - Brent has sampled B15 Ditch 1 & in the process of sampling Ditch 2 (getting the rest laid out)

6 - Enelle 8 - Tunica 1 - Port Arthur

1935 - START-2 off site.

*James Rowland*

06/21/05 Tuesday

0800 - START-2 (Rowland) onsite.

Compass is loading out several trucks to Ethelle & 2 are awaiting to be loaded to Port Arthur.

- Compass continues to backfill.
- BJ & WG are sampling DITCH 3.
- Yesterday BJ was still onsite @ 1815 Sampling DITCH 2.

0925 - Compass begins to load the Port Arthur trucks

- Will suggest to BJ to make sure that Compass does a surface scrape to make sure no contaminated soil is lying around.

1030 - Ditch Sampling is complete. Are awaiting the results.

1200 - As of now Compass has had (2) Twice, (1) Ethelle, (2) Port Arthur.

1245 Rowland breaks for lunch.

1315 Rowland returns from lunch.

- Compass is scraping the bottoms of Grid B2 & B3.

- Brent & Warner Sample B12.

- Compass (R & K) continue with the backfilling & roll compacting of Area "C"

06/21/05 Tuesday

1520 - Two more trucks arrive for non-haz soil to go to Tunica. Compass is still backfilling - Brent Jacobs (URS) Departs site for the week.

1646 - Compass is still onsite doing dust suppression and backfilling. Compass is still cleaning up grid B-3 of any of the straggling to soil. Compass began 1ft. part of B14. Warner will sample B3, 92B13, & 1/2 B14 tomorrow.

1730 - Compass offsite.

1740 - Warner Golden

1750 - Rowland departs site for hotel.

*J. W. Golden*  
*end of Day*

32

(Waukesha 06/22/05)

- 0800 - START-2 (Rowland) onsite. Company is in the process of loading trucks and back filling Area C.
- (AM) is loading out Port Arthur, Emelle and Tunica trucks while
  - KS is doing dust suppression & backfill compaction.
  - RD is dozerizing the backfill in Area "C"
  - BR is doing weight station/manifest & onsite air monitoring.
- 1100 - Data Ditch results are in. It appears that Company will be excavating part of Ditch 1 & Ditch 3 & 4.
- 1230 - WG departs the site. He has sampled B3 & B14.
- 1400 - Mike Vails & Kevin S. come to speak at the ditch.
- 1440 - Company (RD & AM) are still backfilling Area "C"
- 1500 - Mike Vails begins excavate DITCH 1
- 1600 - Mike Vails clips an old gas line that is no longer in use. The gas company comes out.

Wed 06/22/05<sup>33</sup>

Dave Delaney approaches Rowland about the culverts in Ditches 3 & 4. Dave wants to know do if they should take the culverts up or will Steve allow them to leave them in place b/c he said there isn't anything in them. I told him that I would check with Steve.

1700 - Rowland calls Steve about the culverts & Steve says that he wants to know:

1. Measurements
2. How much sediment is in each of them

Steve said that he had considered leaving them in place if they could clean them out.

Rowlands informed Steve that he would let him know the information that he requested.

1745 - Company offsite.

1835 - Rowlands offsite.

To be continued  
End of Day

34

( THURSDAY 06/23/05 )

- 0830 - START-2 Rowland onsite.  
 ~ Compass (MV) is continuing to excavate DITCH 1, & loading trucks to Enelle.
- 0930 - Compass will begin re-excavating B-3. DD have staked his sample points. ~~After~~ MV is awaiting the arrival of Turicahon-haz trucks.
- 0945 - Compass began loading out non-hazardous soil from the DITCH 1 with Turice trucks.
- 1030 - David just took a sample from DITCH 1 @ 6'.  
 David Delaney also informed Rowland that if the city had a sewer clearer then it would be fine to use that to clean the culvert but otherwise they would have to take the culverts out, especially the 60' one.
- Compass has begun to excavate backfill area "D" behind the Admin bldg.
- 1500 - Compass waited the second round of Turice trucks.

35

( THURSDAY 06/23/05 )

- 1330 - An Enelle truck arrived onsite  
 1345 - Trucks for Teme ca arrive  
 1600 - Compass is surveying the site Evans Engineering  
 - Compass is also scraping the rest of the stock pile in "B"  
 - Compass is still back filling "D".  
 - Compass will not be loading anymore trucks for the day.
- 1617 Backfill is still being unloaded.
- 1625 - Compass begins to depart.
- 1700 - START-2 (Rowland) offsite.

*John*

*End of Day*

(FRIDAY 06/24/05)

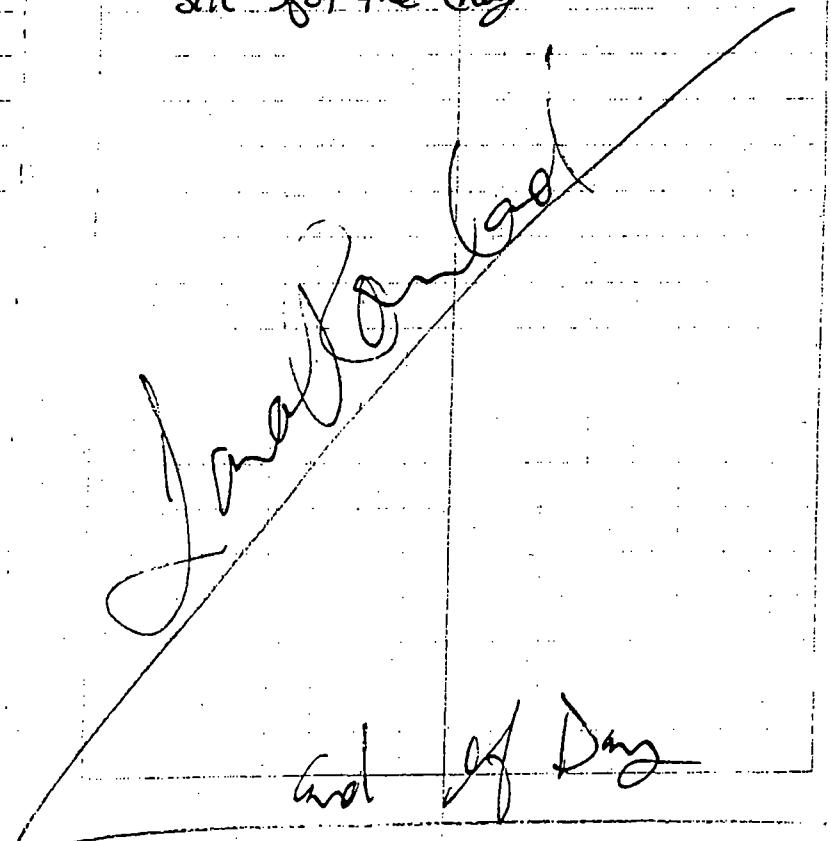

- 08 - START-2 (Rowland) onsite  
 - Compass is currently loading trucks for  
 Trica & accepting backfill.  
 - Compass has lifted the liner from  
 under stockpile "B" & scraped  
 across it.
- 1100 - Dave Delaney comes to sample  
 under the former stockpile.  
 - Compass is in the process of  
 backfilling "B".  
 - Compass may have one truck load  
 left to go to Emelle.  
 - Dave Delaney of URS said that @  
 1700 / 1730 yesterday Steve Spurrier  
 gave verbal ok for backfilling of  
 "B". He also said that that  
 is when Steve said dig 1ft deeper  
 on 83-D alignot. Dave Delaney  
 said that Compass had taken the  
 one foot out (I saw it) and  
 has sampled.
- 1120 - Compass begins to load cut soil  
 DITCH I.
- 1400 - Compass is still backfilling

06/24/05

Area "B"

1430 - Compass will not be  
 excavating any more today,  
 but will continue to backfill  
 area "B". Compass will depart 1500.

START-2 (Rowland) departs  
 site for the day -

6/27/05

- 0930 START II (T. McNEE) ON SITE  
COMPASS HAS DITCH 1 EXCAVATED  
AND IS BEGINNING EXCAVATION  
OF DITCH 2. DATA FROM DITCH  
2 INDICATED NO EXCAVATION  
WAS NECESSARY IN THIS AREA.

Introduction

The following report is a preliminary assessment reassessment (PAR) of Red Panther Chemical Company in Coahoma County, Clarksdale, Mississippi. The original preliminary assessment was performed by the Bureau of Pollution Control (BPC) in June of 1984. A follow-up sampling inspection was performed in August of 1984.

County Code 027

Congressional District: 01

Coordinates: Latitude: 34° 41' 20"  
Longitude: 90° 33' 45"

Location: SW1/4 NW1/4 NE1/4 S25 T27N R4W

Directions to Site: Red Panther Chemical Company is reached by traveling south on Hwy 49 from the intersection of Hwy 61 & Hwy 49. Travel about 1/2 mile to SASSE Street. Take SASSE Street and travel west about .15 of a mile. Red Panther Chemical Company is adjacent to the street on the right side.

Contact Official: Jim Thomas

Background

Red Panther Chemical Company is a pesticide formulating plant. The facility has been engaged in the formulation of liquid and powdered herbicides, insecticides, and fungicides since 1949. Former owners are Coahoma Chemical Company (the original owner), Riverside Chemical Company, and MFC Services (Reference 1).

In 1980, Red Panther filed a RCRA notification for storage of wastewater and dirty solvents in drums and tanks. These wastes are generated from cleaning the process equipment. The wastewater contains pesticide and solvent residues. The dirty solvents contain pesticide residues (References 3 and 18).

In November of 1984, Red Panther obtained a RCRA Part B permit from the BPC for storage of the above mentioned wastes.

In November of 1986, Red Panther's storage permit was terminated because Red Panther lost its liability insurance coverage that is required for long-term storage of hazardous wastes. At that time, Red Panther reverted to the status of a hazardous waste generator with short-term (less than ninety day) storage only.

In November of 1985, there was a fire at one of the Red Panther warehouses. Contaminated runoff resulting from the fire-fighting effort caused a fish kill in the nearby Sunflower River. The contaminant was Lorox, a slightly toxic herbicide. A large volume of contaminated water was contained on site and later shipped to a commercial hazardous waste disposal facility.

During the investigation and cleanup after the fire, 382 old fiber drums were discovered in the crawlspace below the warehouse. Two hundred and eighty-seven of the drums were empty. These drums were crushed and sent to the local municipal landfill. Ninety-five of the drums contained trace residues of technical grade dieldrin and were disposed of at a commercial hazardous waste facility.

At various times in the past, wastewater from the formulating process has apparently been discharged either directly to a ditch off-site or into an underground septic tank and drainfield on-site. Red Panther was issued a "no discharge" permit in 1984 by the BPC (References 1, 4, and 11).

Red Pantner is currently classified as a hazardous waste gernerator (Reference 2).

#### Site Description

Red Panther Chemical Company is located in Clarksdale, Mississippi. The facility is fenced in and is not accessible to non-employees (Reference 18). The facility is bordered on the west by the Illionis Central Railroad tracks. Further west is a housing district. The rest of the facility is surrounded by commercial property (Reference 27).

The facility is approximately 6 1/2 acres in size. A septic tank and drainfield is located on the north side of the property. Three above ground hazardous waste storage tanks with total capacity of 33,000 gallons are located on the south side of the property (References 3 and 7). A small wastewater settling basin is located on the east central side of the property (Reference 8). Drums containing absorbent used for cleaning up process spills may also be buried on-site but the location is unknown (References 1 and 11).

Sampling History

In August, 1984, the BPC performed a sampling inspection at Red Panther Chemical Company (Reference 15). Environmental samples were collected around the site to determine and characterize any hazardous substances present. Two composite soil samples were taken from the off-site ditch along Normandy Street and Patton Street. One water sample was taken where wastewater leaves the property and discharges into the off-site ditch. One subsurface composite soil sample was collected around the septic tank and drainage field. All these samples were analyzed for pesticides and total arsenic (References 12 and 17).

The test results of the soil and sediment samples indicated elevated levels of several pesticides and arsenic.

In November, 1985, due to the warehouse fire, a sample of contaminated runoff resulting from the fire-fighting effort was collected and analyzed for pesticides. None were detected (Reference 16).

Waste Description/Containment

Red Panther Chemical Company generates wastewater and spent solvents from the formulating process. The total annual quantity of hazardous waste reported in the Red Panther 1980 RCRA hazardous waste notification is approximately 6318 kilograms. The estimated waste quantity is 259,044 kilograms (285 tons) based on a forty-one year history of operations (References 1 and 3).

In the past, contaminated wastewater has been discharged to an off-site drainage ditch and also to an on-site underground septic tank and drainfield with little or no containment. The depth of deposited waste is unknown, so a depth of six feet is assumed.

The hazardous substances of concern include arsenic, toxaphene, and dieldrin. Arsenic has a severe toxicity rating and is highly persistent (References 9 and 30).

Groundwater/Geology

Clarksdale is located in northwestern Mississippi in the Mississippi Delta. The stratigraphic units in this part of the state in descending order are as follows:

Mississippi River Valley Alluvium, Cook Mountain, Sparta, Zilpha, and Winona, Tallahatta, Meridian-Upper Wilcox, Lower Wilcox.

The Mississippi River Valley Alluvium (Alluvium Aquifer) is primarily a water table aquifer. The formation dips gently to the south and is exposed at the surface over its entire area of occurrence (Reference 19). The Alluvium Aquifer is one of the most prolific and widespread aquifers in northwestern Mississippi. Alluvial deposits blanket and underlie the entire Mississippi Delta (Reference 20).

The upper surface of the Alluvium Aquifer is the land surface and the base of the alluvium averages about 140 feet lower. Geophysical logs of wells in the site area indicate that the Alluvial Aquifer extends to a depth of approximately 125 feet below the land surface (References 21 and 25). The lower part of the Alluvial Aquifer consists of coarse sand and gravel which grades upward through coarse sand, fine sand, silt, and clay. Results from aquifer tests indicate hydraulic conductivities of 170 to 190 ft/day or  $6.7 \times 10^{-2}$  cm/sec (Reference 22):

The Cook Mountain is composed of clay and shale with an estimated permeability of  $10^{-5}$  cm/sec. In some areas of northwestern Mississippi, the Cook Mountain confines the underlying Sparta aquifer. However, geophysical logs of wells in the vicinity of the site suggest that the Cook Mountain is approaching a stratigraphic pinch-out in the Clarksdale area. Therefore the Alluvial Aquifer and the Sparta are likely hydraulically connected in this area.

The Sparta is composed of rounded, well-sorted quartz grains in two or three thick beds separated by beds of clay. Regionally, water in the Sparta moves from east to west. The unit dips to the west at about 25 feet per mile. Lithologic data and geophysical logs of wells in the surrounding area indicate that the Sparta Aquifer is approximately 500 feet in thickness and occurs at a depth of approximately 155 feet below the land surface in this area. The average hydraulic conductivity of the Sparta is 67 ft/day (References 19, 21, and 25).

The Zilpha and Winona occurs approximately 655 feet below the land surface and underlies the Sparta Aquifer. The Zilpha consists of dark-brown clay which overlies the Winona and prevents movement of water between the Winona and the Sparta. The Winona consists of glauconitic fossiliferous sands and clays (References 19, 20, 22, and 25).

The Tallahatta is hydraulically connected with the overlying Winona. The Tallahatta contains several thick to very thin sand beds that are separated by clay. The aquifer dips to the west and southwest. The aquifer tests on wells in the Winona-Tallahatta Aquifer indicate a hydraulic conductivity of 6.7 ft/day. The base of the Winona-Tallahatta Aquifer is approximately 1120 feet below the land surface (References 19, 21, 22, and 25).

The Meridian Sand of the Tallahatta, together with uppermost sand beds of the Wilcox Group, is an aquifer throughout the area. These units are regarded as one aquifer because they are hydraulically connected.

The Meridian Sand is a massive unit consisting of fine-to-coarse micaceous sand. The Upper Wilcox Aquifer consists of a less permeable sandy clay that dips west to southwest at 28 to 40 ft/mile. The configuration of the top of the Meridian-Upper Wilcox Aquifer occurs approximately 1120 feet below the land surface and is approximately 300 feet in thickness. Hydraulic conductivity of the aquifer ranges between 30 to 68 ft/day (References 19, 21, 22, and 25).

The Lower Wilcox is the deepest aquifer underlying the region. The Lower Wilcox consists of a thick sand unit containing over 60 percent sand. The aquifer dips about 50 ft/mile to the southwest in the southern part of the region. Multiple clay beds in the overlying part of the Wilcox hydraulically separate the Lower Wilcox Aquifer from overlying aquifers. The Lower Wilcox Aquifer occurs approximately 1900 feet below the land surface and extends to a depth of approximately 2100 feet in the site area. Hydraulic conductivity of the aquifer ranges from 29 to 64 ft/day (References 19, 21, 22, and 25).

#### Aquifer of Concern

The Mississippi River Valley Alluvium and Sparta are apparently hydraulically connected in the site area and therefore are considered as one aquifer, the aquifer of concern (AOC). The depth to the water-bearing unit of the Alluvium is approximately 30 feet below the land surface. The Alluvium is composed of silt, clay, and loam in the upper part and coarse sand and gravel in the lower part. The estimated permeability of the unsaturated zone of the Alluvium is  $10^{-4}$  cm/sec (References 20, 22, and 28).

The AOC provides drinking water for 24,700 people within a three-mile radius of the site. This is based on eleven public water supply wells (nine of which are in the three-mile radius) and numerous irrigation wells. All eleven of the public wells are connected, i.e., they provide water to the same distribution system (References 24 and 28).

The nearest drinking water well in the AOC is a public well located about 1100 feet south of the center of the site. This well is identified as J-102 on the USGS printout and overlay sheet (Reference 28).

#### Precipitation

Northwestern Mississippi has a humid subtropical climate influenced by the Gulf of Mexico. Mean annual precipitation is approximately 51 inches of which about one-third runs off and about one-third seeps into the ground. Evapotranspiration accounts for the remaining third. Most of the water that seeps into the ground is later released to the streams. Approximately less than 5% of the rainfall goes into storage in the aquifers. January is the wettest month and October is the driest (Reference 19).

The mean annual lake evaporation for the area is approximately 42 inches. The net annual precipitation of the area is about 9 inches. The one-year, twenty-four-hour rainfall is approximately 3.5 inches (Reference 9).

Surface Water

The site and surrounding area is flat with a slight gradient to the east. The site slope is about 0.6% and the slope of the intervening terrain is about 0.1%. The nearest perennial surface water is the Sunflower River (Reference 27).

Some surface runoff and/or discharge from the facility probably drains into a roadside ditch east of the site. The ditch flows intermittently in an easterly and southerly direction and intersects an intermittent stream approximately 22,440 stream feet southeast of the site. The intermittent stream flows in a westerly direction for approximately 3,960 stream feet before entering the Sunflower River, the nearest perennial surface water. The Sunflower River is located approximately 26,400 stream feet from the site and flows in an southerly direction (Reference 27). The Sunflower River is used for irrigation, industrial and/or commercial purposes, and recreation (Reference 26).

Environmental Concerns

There are no national wildlife refuges, critical habitats of federal endangered species, or wetlands within one mile of the site along the surface water migration pathway (References 27 and 29).

Conclusions and Recommendations

A site screening investigation is recommended on a medium priority basis.

1. Potential Hazardous Waste Site Preliminary Assessment of Red Panther Chemical Company, Prepared by Mississippi Bureau of Pollution Control, April, 1984.
2. EPA HWDMIS Database List of RCRA Hazardous Waste Generators in Mississippi.
3. RCRA Hazardous Waste Part A Permit Application for Red Panther Chemical Company, October, 1980.
4. State of Mississippi Water Pollution Control "No Discharge" Permit, Issued August 1, 1984.

# WATER FOR INDUSTRIAL AND AGRICULTURAL DEVELOPMENT IN

Coahoma, De Soto, Panola, Quitman  
Tate, and Tunica Counties, Mississippi

A COOPERATIVE STUDY SPONSORED BY THE  
U. S. GEOLOGICAL SURVEY  
and the

*Mississippi Research and Development Center*

JACKSON, MISSISSIPPI

1976

study of the Mississippi River valley alluvial aquifer. Vestal (1956) included a discussion of the ground-water resources in his geologic report on Panola County. Earlier reports on public and industrial water supplies (Lang and Boswell, 1960; Wasson, 1965; Callahan, 1973) include data on some or all of the six counties. Reports of ground-water studies made in the Memphis, Tenn., area (Criner, Sun, and Nyman, 1964; Nyman, 1965; Bell and Nyman, 1968) describes aquifers that extend into the northern part of the study area. The results of regional water-resources investigations that include all six counties are published in reports of the U.S. Geological Survey (Cushing, Boswell, and Hosman, 1964; Speer and others, 1964; Hosman and others, 1968; Boswell and others, 1968; Cushing and others, 1970). A report by the Lower Mississippi Region Comprehensive Study Coordinating Committee (1974) includes additional data. Several statewide and areal reports on low flow of streams and on floods include data in the project area. Useful among these are low-flow reports by Golden (1960) and Skelton (1961). U.S. Geological Survey annual water-resources data reports for Mississippi and Tennessee and Corps of Engineers annual reservoir and streamflow data reports are also helpful sources of surface-water information in the study area.

#### Location and Population of the Area

The six counties comprise an area of 3,084 mi<sup>2</sup> (7,988 km<sup>2</sup>) in northwestern Mississippi (fig. 1).

The 1970 population of the six-county area was 149,447 (U.S. Census). Although the total population of the study area declined approximately 4 percent, De Soto County, which includes part of the Memphis metropolitan area, increased 50 percent during the 1960-70 period. There are no major population centers in the six counties; however, in 1970 there were 16 communities having more than 1,000 inhabitants.

Batesville (3,796)	Lambert (1,511)
Clarksdale (21,673)	Marks (2,609)
Coldwater (1,450)	Olive Branch (1,513)
Como (1,003)	Sardis (2,391)
Crenshaw (1,271)	Senatobia (4,247)
Friars Point (1,177)	Southaven (8,931)
Hernando (2,499)	Tunica (1,685)
Jonestown (1,110)	North Tunica (1,325)*

\*Unincorporated

The 1970 population of Shelby County, Tenn., where Memphis is located, was 722,014; this county showed a population increase of 15 percent from 1960 to 1970. It can be expected that further growth of Memphis will add more stress on the ground-water resources in De Soto County and, to a lesser extent, the entire six-county study area.

Approximately 55 percent of the six-county population is served by public water systems.

## HYDROLOGIC SETTING

### Climate

Northwestern Mississippi has a humid subtropical climate influenced by the Gulf of Mexico. Mean annual precipitation in the study area ranges from 50 to 53 in (1,270 to 1,350 mm) of which about one-third runs off, about one-third seeps into the ground, and evapotranspiration accounts for the remainder. Most of the water that seeps into the ground is later released to the streams. Probably less than 5 percent of the rainfall goes into storage in the aquifers. January is the wettest month and October the driest. The table below shows mean monthly and mean annual precipitation by State climatic divisions, namely, the Upper Delta and the North Central. Coahoma, Quitman, and Tunica Counties are in the Upper Delta climatic division. De Soto, Panola, and Tate Counties are part of the North Central climatic division.

Temperatures only occasionally exceed 38°C (100°F) or drop below -12°C (10°F). The mean maximum temperature is 12°C (53°F) in January and 34°C (93°F) in July; the mean minimum temperature is 1°C (34°F) in January and 22°C (71°F) in July. The mean length of the growing season is about 240 days, from March to November. The mean annual air temperature is 17°C (63°F) and the temperature of shallow ground water is approximately the same. The mean annual relative humidity is 70 percent.

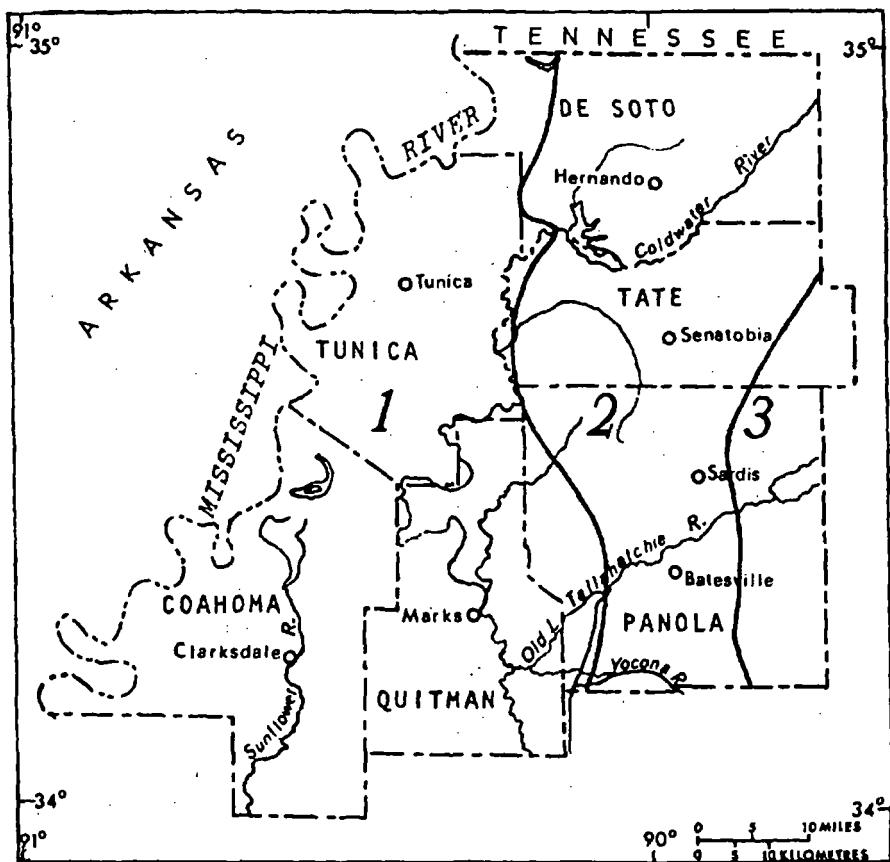

### Topography and Drainage

The study area contains parts of three physiographic districts (fig. 2). The Mississippi Alluvial Plain in the

Table I. -- Stratigraphic units and their water-bearing character

Era- them	System	Series	Group	Stratigraphic unit	Thickness (ft)	Water-bearing character
Cenozoic	Quaternary	Holocene and Pleistocene		Flood-plain deposits (other than Mississippi River alluvium)	0-60	Small water supplies available from shallow wells.
				Mississippi River alluvium	0-200	Water is hard and contains iron. The principal source of water for irrigation and cooling. Yields up to 5,000 gal/min to irrigation wells.
				Loess	0-30	Not an aquifer.
				Terrace deposits	0-120	Wells with yields up to 100 gal/min could be developed in some places where these deposits are present.
	Tertiary	Eocene	Claiborne	Cook Mountain Formation	0-200	Not an aquifer.
				Sparta Sand	0-800	A principal aquifer in Coahoma, De Soto, Panola, and Tate Counties. Yields up to 3,000 gal/min to industrial wells. Potential aquifer in Quitman and Tunica Counties. Iron and pH are problems locally.
				Zilphal Clay	0-120	Not an aquifer.
				Winona Sand	0-40	Not a major aquifer in study area.
				Tallahatta Formation	150-500	Not generally used in study area. A potential aquifer in parts of Quitman, Tate, and Tunica Counties. Source of water for wells in eastern part of Panola County.
				Meridian Sand Member		50-350 feet thick. A principal aquifer in Coahoma and Quitman Counties. Potential source of water in Panola, Tate, and Tunica Counties. Iron and low pH are problems locally.
	Paleocene	Wilcox	upper part		450-950	Minor aquifers in the middle part of the Wilcox are local sources of water in Panola County and potential major sources in Quitman County.
				middle part		
				lower part		50-360 feet thick. A principal aquifer in Panola, Quitman, Tate, and Tunica Counties; important in Coahoma and De Soto Counties.
			Midway	Undifferentiated	550-900	No aquifers.
Mesozoic	Cretaceous	Upper Cretaceous	Selma	Ripley Formation and Coffee Sand, undivided	900-1,200	No wells. These formations are the only Cretaceous aquifers that contain fresh water in eastern De Soto and northeastern Tate Counties. Saline in Coahoma, Panola, Quitman, Tunica, and most of Tate and western De Soto Counties.
Paleozoic				Undifferentiated		Not known to contain aquifers in study area.

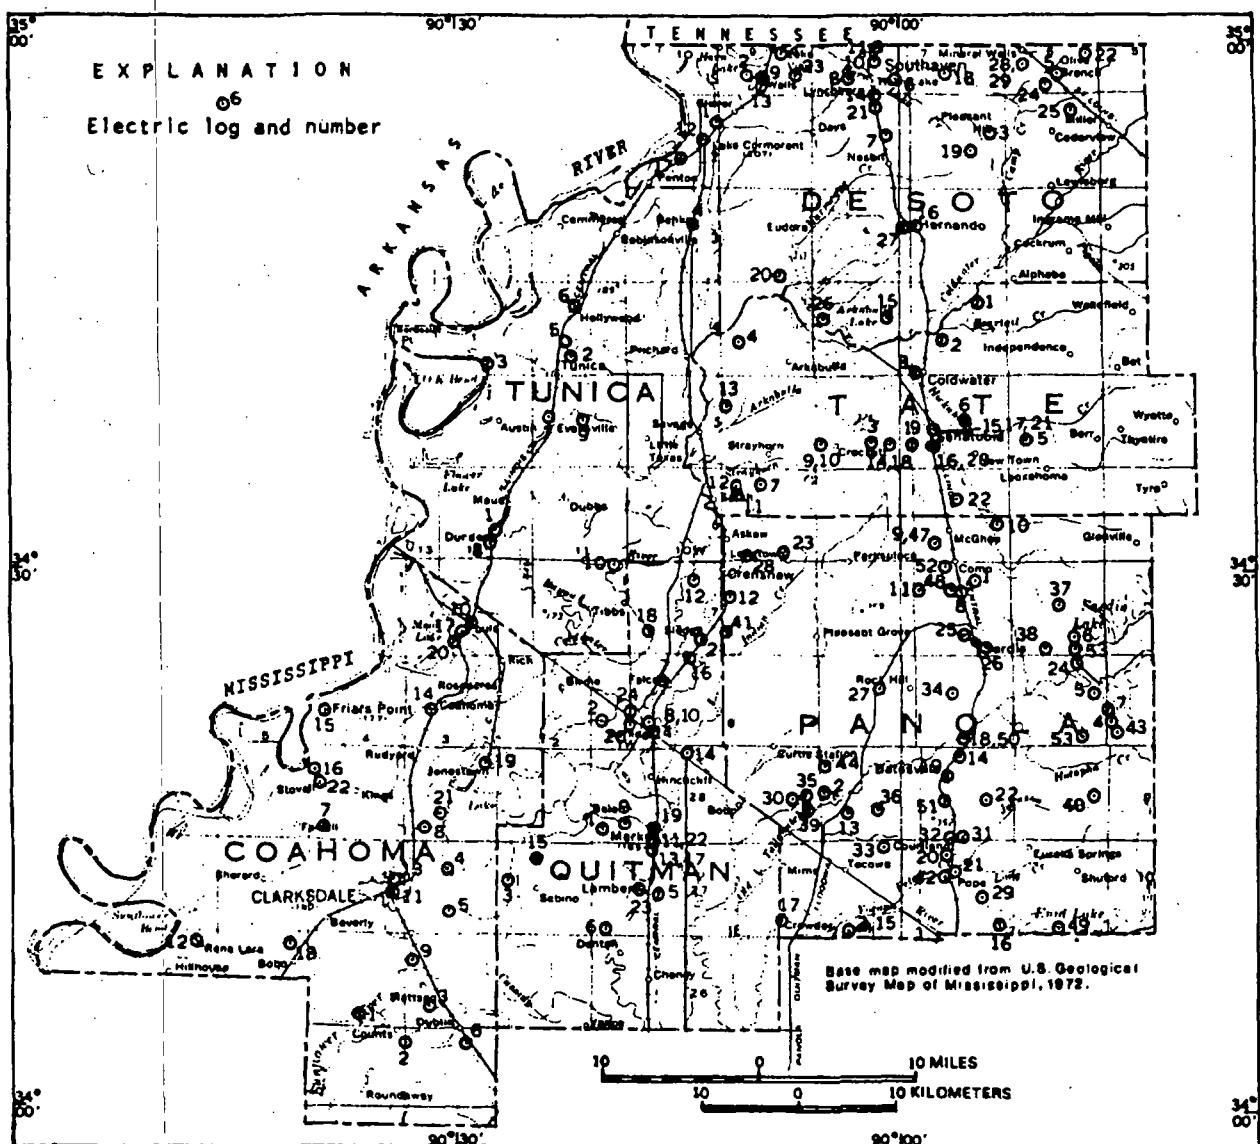

Figure 17.--Locations of electric log sites.

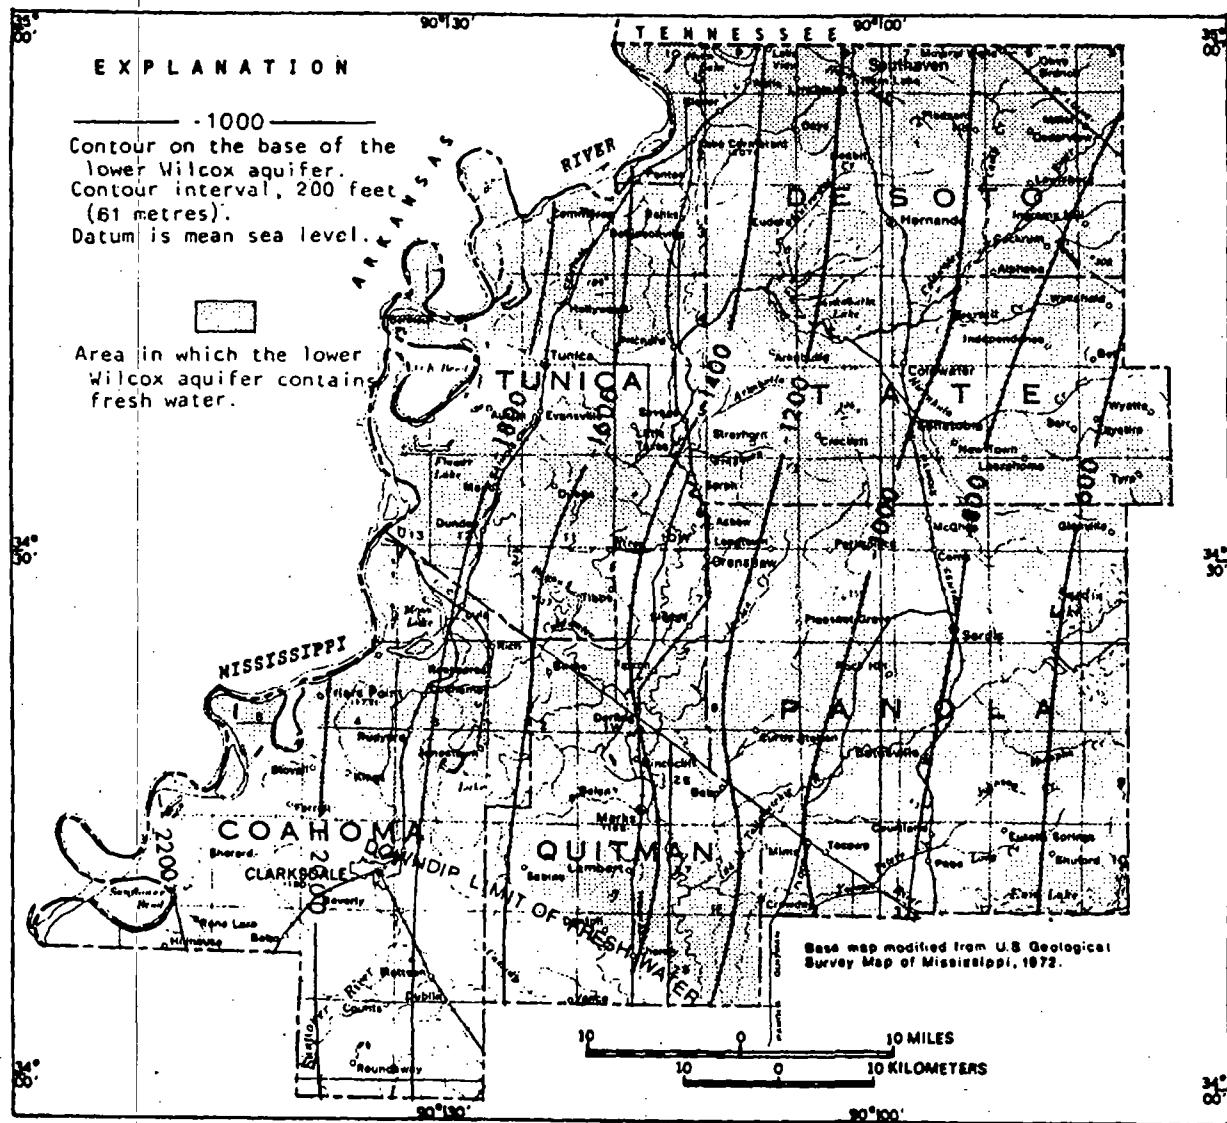

Figure 18.--Fresh-water occurrence in the lower Wilcox aquifer.

The thickness of the lower Wilcox aquifer ranges from 50 to 360 ft (15 to 110 m) in the area where it contains fresh water. Individual sand beds supplying water to major wells are indicated by electric logs to range in thickness from about 50 to 140 ft (15 to 43 m) with 100 ft (30 m) as the average. Sand beds thicker than 250 feet (76 m) in northwestern De Soto County have been reported on driller's logs; thicknesses of at least 180 ft (55 m) have been noted in northern Quitman County (table 1).

The movement of water in the lower Wilcox aquifer is westward. Altitudes of potentiometric surfaces range from about 200 ft (61 m) above sea level in eastern Panola and Tate Counties to less than 190 ft (58 m) in the remainder of the study area. Many lower Wilcox wells still flow in the parts of Coahoma, Panola, Quitman, and Tate Counties that are in the Mississippi Alluvial Plain; however, pumps are now used on most wells because of substantial losses of artesian pressure associated with increasing water withdrawal during the past several years. Water levels of nonflowing wells in the Mississippi Alluvial Plain range from 0 to about 30 ft (0 to 9 m) below land surface, which is at an altitude of 140 to 210 ft (43 to 64 m). Water levels in wells outside the Mississippi Alluvial Plain range from 50 to 180 ft (15 to 55 m) below land surface, which is at an altitude of 200-580 ft (61 to 177 m).

Most of the major wells now producing water from the lower Wilcox are in Panola, Quitman, Tate, and Tunica Counties. Wells in these counties produce 100 to 1,000 gal/min (6 to 63 l/s); however, the aquifer is capable of much larger yields in many places. Measured specific capacities<sup>1</sup> range from 4.5 to 27 (gal/min)/ft, or 1.6 (l/s)/m, of drawdown--the average is 15 (gal/min)/ft, or 3 (l/s)/m.

Several pumping tests in the area indicated transmissivity<sup>2</sup> (transmissibility) values ranging from 3,300 to 8,000 (ft<sup>2</sup>/d)/ft, or 306 to 740 (m<sup>2</sup>/d)/m. Hydraulic conductivity (permeability) values, as indicated by these tests, range from 29 to 64 (ft<sup>3</sup>/d)/ft<sup>2</sup>, or 9 to 20 m/d, and average 41 (gal/d)/ft<sup>2</sup>, or 13 m/d.

Water from lower Wilcox wells in the area is a sodium bicarbonate type. Hardness does not exceed 21 mg/l. With the exception of several wells in Coahoma and Quitman Counties, the dissolved-solids concentration

<sup>1</sup>Specific capacity is given for a 1-day period of pumping, the data projected if the pumping period is less than 1 day.

<sup>2</sup>The term "transmissivity" replaced "transmissibility" in U. S. Geological Survey terminology in 1972. At that time the units expressing the parameter were changed from gallons per day per foot to cubic feet per day per foot. Similarly, "hydraulic conductivity" replaced "permeability" and the units were changed from gallons per day per square foot to cubic feet per day per square foot. Hydraulic conductivity is calculated by dividing transmissivity by aquifer thickness.

is not greater than 300 mg/l. Chemical analyses show iron in solution ranging from 0.01 to 0.90 mg/l but generally less than 0.3 mg/l. The pH is 7.2 to 8.7. There is little or no color to the water, and water temperature ranges from 20° to 28°C, depending on the depth of the well.

#### Minor Wilcox Aquifers

Several discontinuous beds of sand occur between the Meridian-upper Wilcox aquifer and the lower Wilcox aquifer. These sand beds, which average about 50 ft (15 m) in thickness, are 40 to 100 (12 to 30 m) and 25 to 60 ft (8 to 18 m) thick in Panola and Quitman Counties, respectively. Elsewhere, the sand beds may be represented by a few to several beds 10 to 20 ft (3 to 6 m) in thickness.

A few large-capacity wells in Panola County tap the minor Wilcox aquifers. These wells range from 823 to 966 ft (251 to 294 m) in depth and yield 80 to 750 gal/min (5 to 47 l/s); the higher yields are in Panola County. Water levels outside the Mississippi Alluvial Plain are 255 and 200 ft (78 and 61 m) above sea level at Sardis and in the Pope-Courtland area, respectively. A well at Crowder, in the Mississippi Alluvial Plain, flows. Analysis of a pumping test in Panola County indicated a transmissivity of 800 (ft<sup>2</sup>/d)/ft, or 75 (m<sup>2</sup>/d)/m; the hydraulic conductivity was 19 (ft<sup>3</sup>/d)/ft<sup>2</sup>, or 6 m/d. Measured specific capacities for wells in these aquifers were 16 and 22 (gal/min)/ft, or 3.5 and 4.5 (l/s)/m.

Water from wells in the minor Wilcox aquifers in Panola County is a sodium bicarbonate type. Hardness is not over 35 mg/l, and the iron concentration is less than 0.3 mg/l. Dissolved-solids concentration is less than 400 mg/l. pH is 7.2 to 8.4, and there is little or no color to the water. Water temperature is 20° to 23°C.

#### Meridian-Upper Wilcox Aquifer

The Meridian Sand Member of the Tallahatta Formation, together with the uppermost sand beds of the Wilcox Group, is an aquifer throughout the area. The Meridian-upper Wilcox aquifer, ranging in thickness from 50 to 350 ft (15-107 m), is used as a source of water in Coahoma, Quitman, and Panola Counties. In the northern half of De Soto County, the Meridian-upper Wilcox aquifer combines with the lower part of the Claiborne Group to form the Memphis aquifer ("500-foot" sand), which is the principal source of ground water in northern De Soto County and the adjacent Memphis, Tenn., area. The base of the aquifer ranges from near sea level in southeastern Panola County to more than 1,400 ft (427 m) below sea level in western Coahoma County (fig. 19).

The average thickness of the Meridian-upper Wilcox aquifer in the study area, determined from electric logs

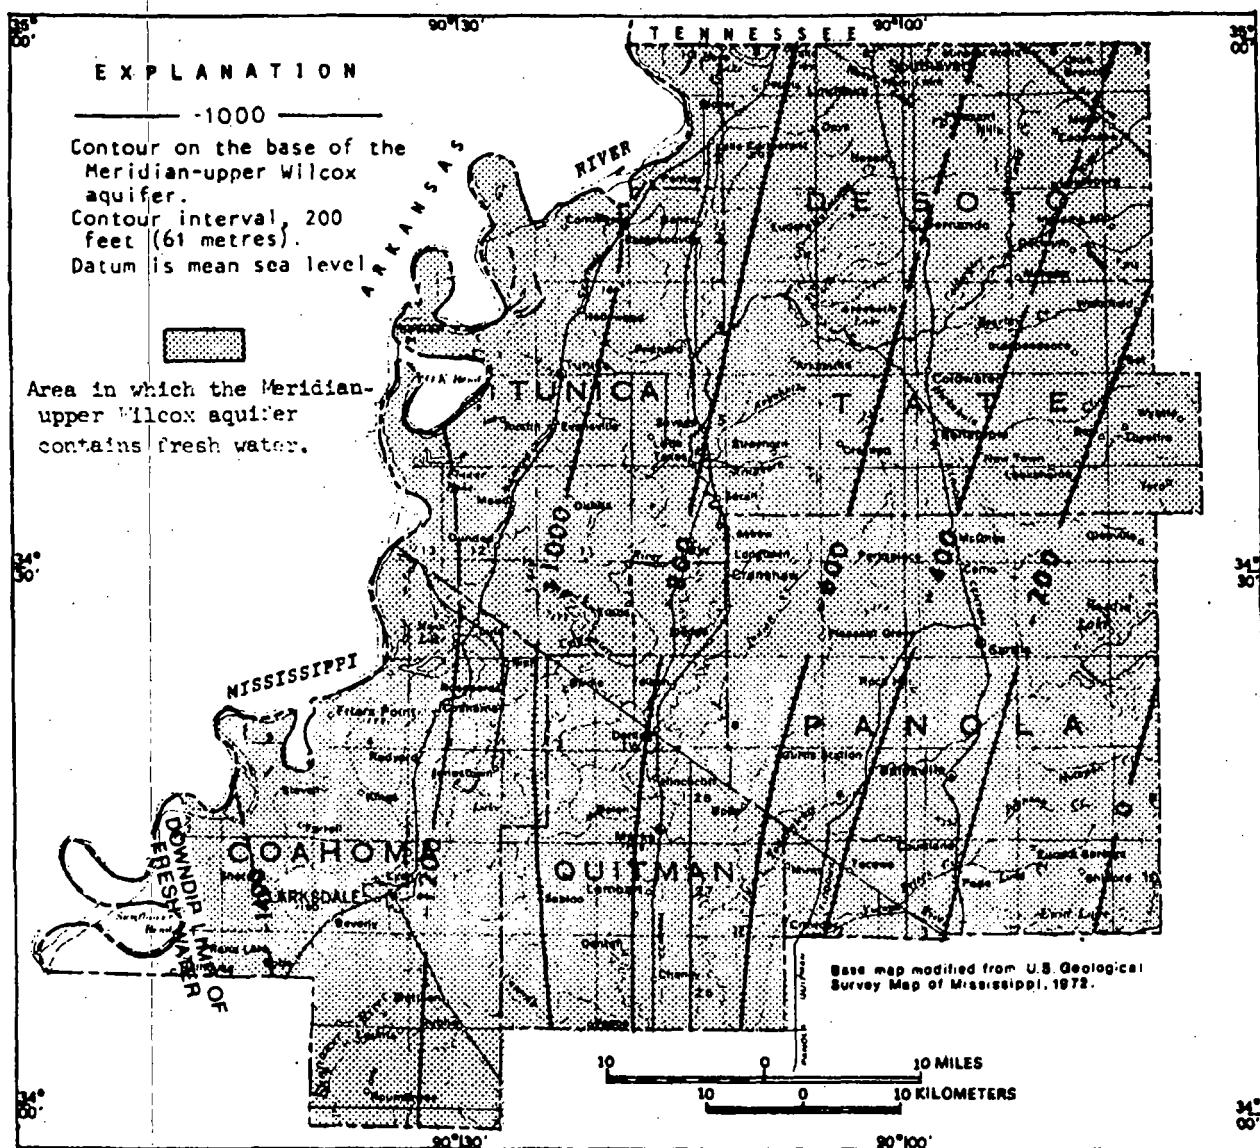

Figure 19.--Fresh-water occurrence in the Meridian-upper Wilcox aquifer.

and driller's logs, is about 220 ft (67 m). The average thickness in Coahoma, De Soto, Panola, and Quitman Counties is about 160 ft (49 m), and in Tate and Tunica Counties it is about 300 ft (91 m). Individual sand beds supplying water to major wells range in thickness from about 45 to 160 ft (14 to 49 m) and the average is 90 ft (27 m). At some locations, discontinuous sand beds are thin and numerous and are separated by thin clay lenses.

The regional movement of water in the Meridian-upper Wilcox aquifer is westward. The potentiometric surface is more than 200 ft (61 m) above sea level in Tate and eastern Panola Counties and between 150 and 200 ft (46 and 61 m) in the remainder of the study area. In turn, water levels in wells range from 13 ft (4 m) above land surface to 114 ft (35 m) below land surface, depending on location and topography. Some wells flow--most of these wells are in the Mississippi Alluvial Plain where land-surface altitudes are low.

Large-capacity wells yield 40 to 650 gal/min (3 to 41 l/s)--average yield is 230 gal/min (15 l/s); and the aquifer is capable of much higher yields in many places. Specific capacities ranging from 2 to 22 (gal/min)/ft of drawdown, or 0.5 to 5 (l/s)/m, have been measured, and the average is 6 (gal/min)/ft, or 1.5 (l/s)/m.

Pumping tests indicated transmissivity ranging from 2,900 to 4,700 (ft<sup>2</sup>/d)/ft, or 270 to 430 (m<sup>2</sup>/d)/ft, and hydraulic conductivity ranging from 30 to 68 (ft<sup>2</sup>/d)/ft<sup>2</sup>, or 9 to 21 m/d. The average hydraulic conductivity elsewhere in Mississippi is about 53 (ft<sup>2</sup>/d)/ft<sup>2</sup>, or 16 m/d.

Water in the Meridian-upper Wilcox aquifer is soft and may be either a sodium bicarbonate or calcium bicarbonate type. Dissolved solids exceed 500 mg/l in water from several wells deeper than 1,200 ft (366 m) in Coahoma County. Excessive iron and low pH are problems locally in public supplies--iron concentration sometimes exceeds 1 mg/l, and pH is as low as 6.1. One chemical analysis indicates a fluoride concentration of 1.3 mg/l, which is 0.3 mg/l higher than the recommended maximum concentration (U.S. Public Health Service, 1962). There is little or no color in the water. Water temperature ranges from 19° to 27°C.

#### Tallahatta Formation

The Tallahatta Formation occurs throughout the study area. It is difficult to differentiate the Tallahatta from the overlying units in the Claiborne Group in the northern two-thirds of De Soto County, and it is hydraulically connected with the overlying Winona Sand throughout most of the project area. Thickness ranges from 50 to 400 ft (15 to 122 m), and the average thickness is slightly more than 200 ft (61 m). The Tallahatta Formation generally contains several thick to very thin sand beds that are separated by clay.

The thickness of most sand beds is less than 25 ft (8 m); however, in many places there are water-bearing sand beds 40 ft (12 m) to more than 100 ft (30 m) in thickness that are capable of large yields.

A few major wells produce water from the undifferentiated Tallahatta Formation. Depths of these wells range from about 300 ft (91 m) in eastern Panola County to more than 600 ft (183 m) in central Quitman County, and reported yields average 140 gal/min (9 l/s). Some wells in the Tallahatta flow in the Mississippi Alluvial Plain. Water levels in major wells in eastern Panola County are about 250 ft (76 m) above sea level.

Water in the Tallahatta Formation is soft and may be either a sodium-bicarbonate or sodium-calcium bicarbonate type. Chemical analyses of water from wells in Panola and Quitman Counties indicate a dissolved-solids concentration less than 500 mg/l. Iron concentration is less than 0.3 mg/l, but low pH causes corrosion problems locally. There is little or no color in the water. Water temperatures range from 17° to 20°C.

#### Sparta Sand

The Sparta Sand is the shallowest, or youngest, principal aquifer of Tertiary age. The Sparta crops out and receives its recharge in parts of De Soto, Panola, and Tate Counties where it is not covered by loess (fig. 5). The Sparta Sand contains fresh water throughout the study area, except where it is missing due to erosion in Panola and Quitman Counties. The base of the Sparta Sand ranges from about 200 ft (61 m) above sea level in the east to about 800 ft (244 m) below sea level in the west (fig. 20). The dip is about 20 ft/mi (4 m/km).

In most of De Soto County, the Sparta Sand is equivalent to the upper part of the Memphis aquifer and is difficult to differentiate from the underlying Tertiary and overlying terrace deposits, all of which are hydraulically connected. In the southern third of De Soto County the Sparta Sand and underlying Tertiary deposits undergo a lateral transition (facies change) to more distinct deposits of sand and clay. In the study area, the Sparta Sand in most of De Soto County also includes beds that may be equivalent to the Zilpha Clay, Winona Sand, and Tallahatta Formation. Highly permeable sands in these deposits are numerous and very thick. South of the transition zone in De Soto County, the Sparta Sand becomes a more distinct unit.

In western Coahoma County, the Cockfield Formation may be present between the Cook Mountain Formation and the Mississippi River valley alluvial aquifer, and in western Tunica County both the Cook Mountain and Cockfield Formations may be present between the Sparta Sand and the Mississippi River valley alluvial aquifer. These units also are difficult to distinguish from the Sparta Sand. The Mississippi River

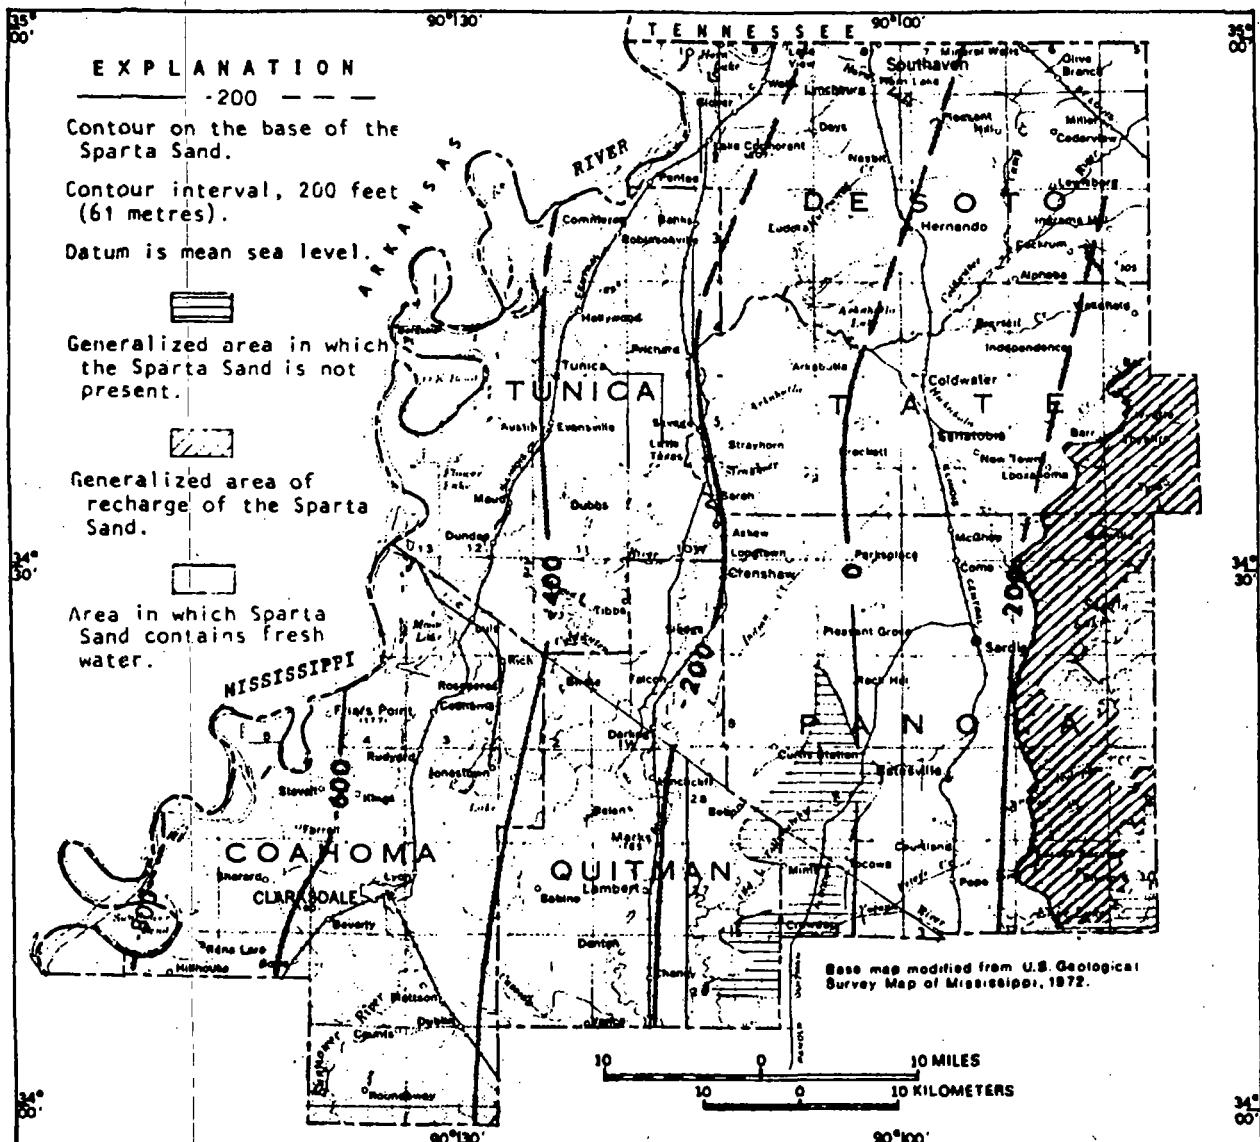

Figure 20.--Fresh-water occurrence in the Sparta Sand.

valley alluvial aquifer is in places hydraulically connected to the Sparta Sand.

Thickness of the Sparta Sand ranges from 240 to 800 ft (73 to 244 m) in De Soto County; 420 to 480 ft (128 to 146 m) in Coahoma County; 300 to 350 ft (91 to 107 m) in Tunica County; 100 to 350 ft (30 to 107 m) in Tate County, 0 to nearly 200 ft (30 to 61 m) in Quitman County; and 0 to 200 ft (0 to 61 m) in Panola County. Water-bearing sands in the Sparta Sand, many 100 ft (30.5 m) or more in thickness, are separated by varying thicknesses of clay.

The regional movement of water in the Sparta Sand is from east to west, as in most other aquifers of Tertiary age in the study area. However, heavy pumping in the Memphis metropolitan area (Tennessee and Mississippi) has caused the water level in the Sparta Sand to decline more rapidly in De Soto County than in other parts of the project area. In the Mississippi Alluvial Plain, water levels are 5 to 80 feet below land surface (2 to 24 m), and the average is 42 ft (13 m); the altitude of the potentiometric surface ranges from about 90 to 163 ft (27 to 50 m) above sea level. East of the Mississippi Alluvial Plain, water levels are 50 to 160 ft (15 to 49 m) below land surface, and the average is about 100 ft (30 m); the altitude of the potentiometric surface here ranges from about 170 to 280 ft (52 to 85 m) above sea level.

The most productive public and industrial water-supply wells in the six-county area are screened in the Sparta Sand. Most of these wells are in Coahoma and De Soto Counties; however, several large wells are in Panola and Tate Counties. Large wells made in the Sparta Sand produce 100 to 3,000 gal/min (6 to 190 l/s), and the average is about 800 gal/min (50 l/s). Some wells in De Soto and Coahoma Counties pump 1,000 gal/min (63 l/s) or more, and specific capacities are high, ranging from 18 to 65 (gal/min)/ft, or 4 to 14 (l/s)/m.

The estimated transmissivity for the total thickness of the Memphis aquifer in the Memphis area is 53,000 ( $\text{ft}^2/\text{d}$ )/ $\text{ft}^2$  or 5,000 ( $\text{m}^2/\text{d}$ )/m, and the hydraulic conductivity is about 74 ( $\text{ft}^3/\text{d}$ )/ $\text{ft}^2$ , or 22 m/d, according to Criner, Sun, and Nyman (1964). The Sparta Sand in De Soto County north of the zone of transition probably has transmissivity similar to that of the Memphis aquifer. The average hydraulic conductivity of the Sparta Sand in Mississippi is 67 ( $\text{ft}^3/\text{d}$ )/ $\text{ft}^2$ , or 20 m/d; hence, under confined conditions a water-bearing sand 100 ft (30 m) thick would have a transmissivity of 6,700 ( $\text{ft}^3/\text{d}$ )/ $\text{ft}$ , or 620 ( $\text{m}^3/\text{d}$ )/m.

Water from the Sparta Sand in the area may be either a calcium-magnesium bicarbonate or a sodium bicarbonate type. Water from most wells does not exceed 60 mg/l in hardness, but in some areas of Coahoma and De Soto Counties the hardness ranges from 150 to 290 mg/l. Friars Point is the only place where water in the Sparta Sand has a dissolved-solids concentration greater than 500 mg/l. Excessive iron in

solution is a common problem locally in public supplies; low pH, which can cause corrosiveness and unsuitability of water for many industrial uses, is also common. There is little or no color in the water. Water temperature ranges from 16° to 22°C.

#### Mississippi River Valley Alluvial Aquifer

The Mississippi River valley alluvial aquifer, bordered on the west by the Mississippi River and on the east by steep, loess-covered hills, is the most productive aquifer in the six-county study area, although it is not as extensive areally as the other principal aquifers. It occupies slightly more than half of the study-area surface, including all of Coahoma, Quitman, and Tunica Counties, the western portions of De Soto and Tate Counties, and southwestern Panola County (fig. 5). A report by Harvey (1956) states that the alluvial deposits of the Mississippi River, consisting of clay, silt, sand, and gravel, are as much as 200 ft (61 m) thick and average 140 ft (43 m). The lower part of the Mississippi River valley alluvial aquifer consists of coarse sand and gravel which grades upward through coarse sand, fine sand, silt, and clay. In places, it is probably hydraulically connected to the underlying deposits of the Claiborne Group.

Precipitation (to a large extent), the Mississippi River, and probably in places in underlying Claiborne Group, all serve to recharge the Mississippi River valley alluvial aquifer. During most of the year, when ground-water levels are high, water from the aquifer seeps into streams. Water levels in nearby wells directly reflect the stage of the Mississippi River. Except near points of heavy pumping, water levels in wells are generally between 5 and 30 ft (2 and 9 m) below land surface.

Principal uses of water from the Mississippi River valley alluvial aquifer are for irrigation and industry. Large wells produce between 600 and 5,000 gal/min (38 and 315 l/s). Specific capacities of large wells are usually between 75 and 150 (gal/min)/ft, or 16 and 32 (l/s)/m.

Water in the Mississippi River valley alluvial aquifer is a hard, iron-rich, calcium magnesium-sodium bicarbonate type. Dissolved solids range from 150 to 400 mg/l. The iron concentration ranges from about 2 to 14 mg/l. Fluoride ranges from 0.0 to 0.4. pH is 6.5 to 8.5—the average is 7.6. There is little or no color in the water. Water temperature, which may be affected somewhat by the seasonal fluctuations in air temperature, ranges from 16° to 19°C.

#### Water Wells

The hydraulic-rotary method is used to drill most of the wells in the project area. Industrial and municipal-supply wells, which are mostly made in the Tertiary aquifers, are constructed by casing the initial drill hole to the top of the aquifer. The annular space

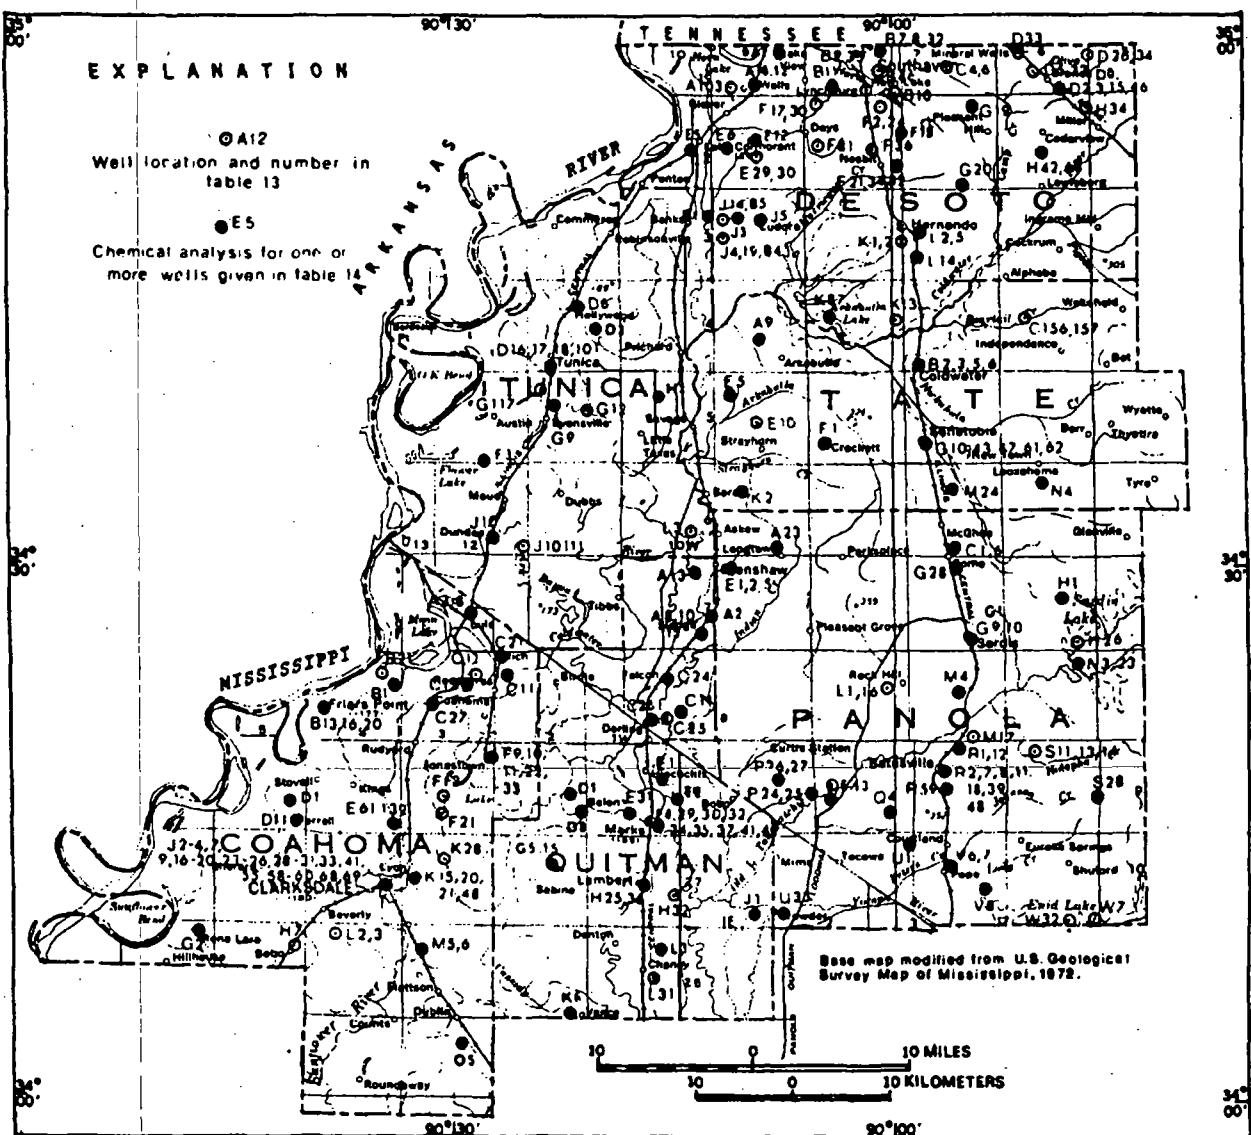

Figure 21.--Selected wells in the six-county project area.

between the drill hole and the well casing is commonly filled with cement. A screen of smaller diameter, either of the wire-wrapped or shutter type, is attached to a pipe, inserted through the well casing, and set opposite the aquifer. In many of these wells, a gravel fill is placed in the annular space between the drill hole and the screen. This is accomplished by enlarging the hole below the well casing before setting the screen. After setting the screen and before sealing the lap pipe to the casing, sorted gravel is placed into the reamed area to form a highly permeable zone around the screen. Usually, the lap pipe above the screen is sealed to the casing. Wells made in the Tertiary aquifers require screen materials capable of withstanding corrosion and other deterioration.

Irrigation wells are generally drilled by the reverse hydraulic-rotary method. Iron shutter-type screens or perforated pipe of the same diameter as the casing are generally used and the casing is not cemented. Gravel may be placed around the screen but often this is not necessary. The noncorrosive water in the alluvial aquifer permits utilization of the cheapest materials, yet the wells have a long life. Well depths seldom exceed 150 ft (45.7 m) and the pumping lift is commonly less than 80 ft (24.4 m). There are no sanitary requirements for irrigation wells.

Public and industrial water-supply wells now in use range in depth from 83 to 1,960 ft (25 to 567 m) and produce water from aquifers of Tertiary age. Wells screened in Tertiary aquifers are deepest in Tunica County and shallowest in De Soto County. Average yields for major wells in Tertiary aquifers are highest in Coahoma and De Soto Counties and lowest in Quitman County. The yields of these wells range from 30 to 3,000 gal/min (2 to 190 l/s). Irrigation wells screened in the Mississippi River valley alluvial aquifer range from 50 to 150 ft (15 to 46 m) in depth and have yields ranging from 600 to 5,000 gal/min (38 to 315 l/s). Selected wells are described in table 13 and their locations are shown on figure 21.

Well data may also include driller's logs and electric logs, which provide information on aquifer thickness and may be used in estimating hydraulic characteristics.

#### Water Levels and Pumping Effects

Knowledge of water levels is needed in planning water-supply development. Static (nonpumping) water levels affect the available drawdown. Shallow static water levels are desirable because deeper water levels cause an increase in the cost of construction and pumping. Water levels change regionally but are affected more by nearby pumping wells, either in the same aquifer or in hydraulically connected aquifers.

Water levels in observation wells reflect regional trends and local fluctuations in ground-water levels (figs. 22-24). Observation wells in the lower Wilcox aquifer show water-level declines ranging from 1 to

1½ ft. (0.3 to 0.5 m) per year in the study area. Water levels in the Meridian-upper Wilcox aquifer and in the Sparta Sand have declined about 1 ft (0.3 m) per year during the past 10 years. The present rate of water-level decline in the Memphis aquifer is about 1 ft (0.3 m) per year near the weighted center of pumping in the Memphis area and about 0.1 ft. (0.03 m) per year at a distance of about 30 mi from this center (J. H. Criner, oral commun., 1975). Water levels in the Mississippi River valley alluvial aquifer, which change seasonally as a result of pumping as well as natural discharge and recharge, are lowest near the end of the irrigation season and highest in the spring just before the irrigation season.

Pumping from a well results in a decline of the water level in the well (drawdown) and in the aquifer. Pumping thus causes a cone of depression in the potentiometric surface around the pumping center and serves to induce into the area some of the water that would otherwise flow past it. The amount of drawdown in a well is a function of the rate of discharge, the transmissivity of the aquifer, and the well efficiency. A well is efficient when the pumping water level in the well is not much below the water level, or potentiometric surface, outside the well. Few wells are 100-percent efficient, but some approach that efficiency.

Predictions of water-level drawdown based on known or estimated transmissivities and for different pumping rates for wells tapping the aquifers described in this report are shown in figure 25. The drawdown will be increased proportionately where a well has an efficiency less than 100 percent.

A pumping well affects the water levels of nearby wells. The magnitude of the effect is a function of the rate of discharge, the time that has elapsed since pumping began, and transmissivity of the aquifer. If the transmissivity of an aquifer is known or can be estimated, the effect that pumping a well will have on other wells in the same aquifer may be calculated (fig. 26). Consideration of drawdown effects for various combinations of time and distance is necessary to planning well spacing and withdrawal rates. For example, for a 12-inch (305-mm) well which pumps 500 gal/min (32 l/s) from an aquifer having a transmissivity of 20,000 (gal/d)/ft, or 250 (m<sup>3</sup>/d)/m, the drawdown would be 50 ft (15 m) at the end of 1 day (fig. 25). After 100 days of pumping there would be about 25 ft (8 m) of drawdown at a distance of 500 ft (152 m) from the pumped well (fig. 26).

One of the principal problems with water wells is drawdown interference. Spacing wells over a large area will tend to minimize the interference between wells. If withdrawals can be distributed among two or more aquifers, as at Clarksdale, interference is further reduced.

Deterioration of water quality is a potential problem in wells screened near the fresh water-saline water

BUREAU OF POLLUTION CONTROL

mapping program. More detailed potentiometric maps prepared recently for several aquifers have been utilized here. Additional maps in the following section were completed using information from the files of the U.S. Geological Survey.

The following section describes the geologic and hydrologic characteristics of major aquifers in the state and delineates the downdip limits of fresh, slightly saline, and moderately saline water. Areas of current and potential use as a source of drinking water are described. The area of potential use is defined as extending to the 10,000 mg/L dissolved-solids line.

#### Mississippi River Valley Alluvial Aquifer

The Mississippi River valley alluvial aquifer is located along the western boundary of the state. North of Warren County it extends farther to the east in an area known as the "Delta" (fig. 5). The formation dips gently to the south and is exposed at the surface over its entire area of occurrence. It was deposited by the Mississippi River and extends into Arkansas, Louisiana, Kentucky, Tennessee, and Missouri. The alluvial aquifer ranges from less than 50 to more than 200 feet thick, averaging 140 feet thick (fig. 6). It is thickest where it has filled in old stream channels. The aquifer generally consists of three layers: a lower gravel and sand layer, a middle sand layer, and a discontinuous silty clay layer at the surface.

The Mississippi River valley alluvial aquifer is primarily a water-table aquifer. Water levels average 20 feet below land surface, but seasonally fluctuate from about 30 feet below land surface during summer and fall to near the land surface during spring (fig. 7). Generally, recharge is from rainfall directly on the aquifer, and water moves to the south and towards streams in the area. Some water moves into the underlying Sparta and Cockfield aquifers which subcrop below the alluvium in the Delta. The Cook Mountain Formation, which acts as a confining unit in most of the State is sandy where it subcrops in the Delta, and some water also moves into it. South of Warren County, water movement is into the underlying Oligocene and Miocene aquifers. Seasonally, some streams may recharge the aquifer.

Results from fourteen aquifer tests in the alluvial aquifer indicate transmissivities of 13,000 to 79,000 ft<sup>2</sup>/day, hydraulic conductivities of 170 to 190 ft/d, and specific capacities of 10 to 168 (gal/min)/ft of drawdown (Dalsin, 1978). Wells are from 60 to 260 ft deep with the deepest, screened in the basal gravel, producing 250 to 5,000 gal/min. Most large wells are irrigation wells although the aquifer also supplies municipalities and industries. Continued and increased use can be supported by the aquifer in future years.

Water from the alluvial aquifer is fresh in its entire area and contains less than 500 mg/L dissolved solids throughout most of its area. The water is a hard, generally alkaline, calcium-bicarbonate type that commonly has excessive iron.

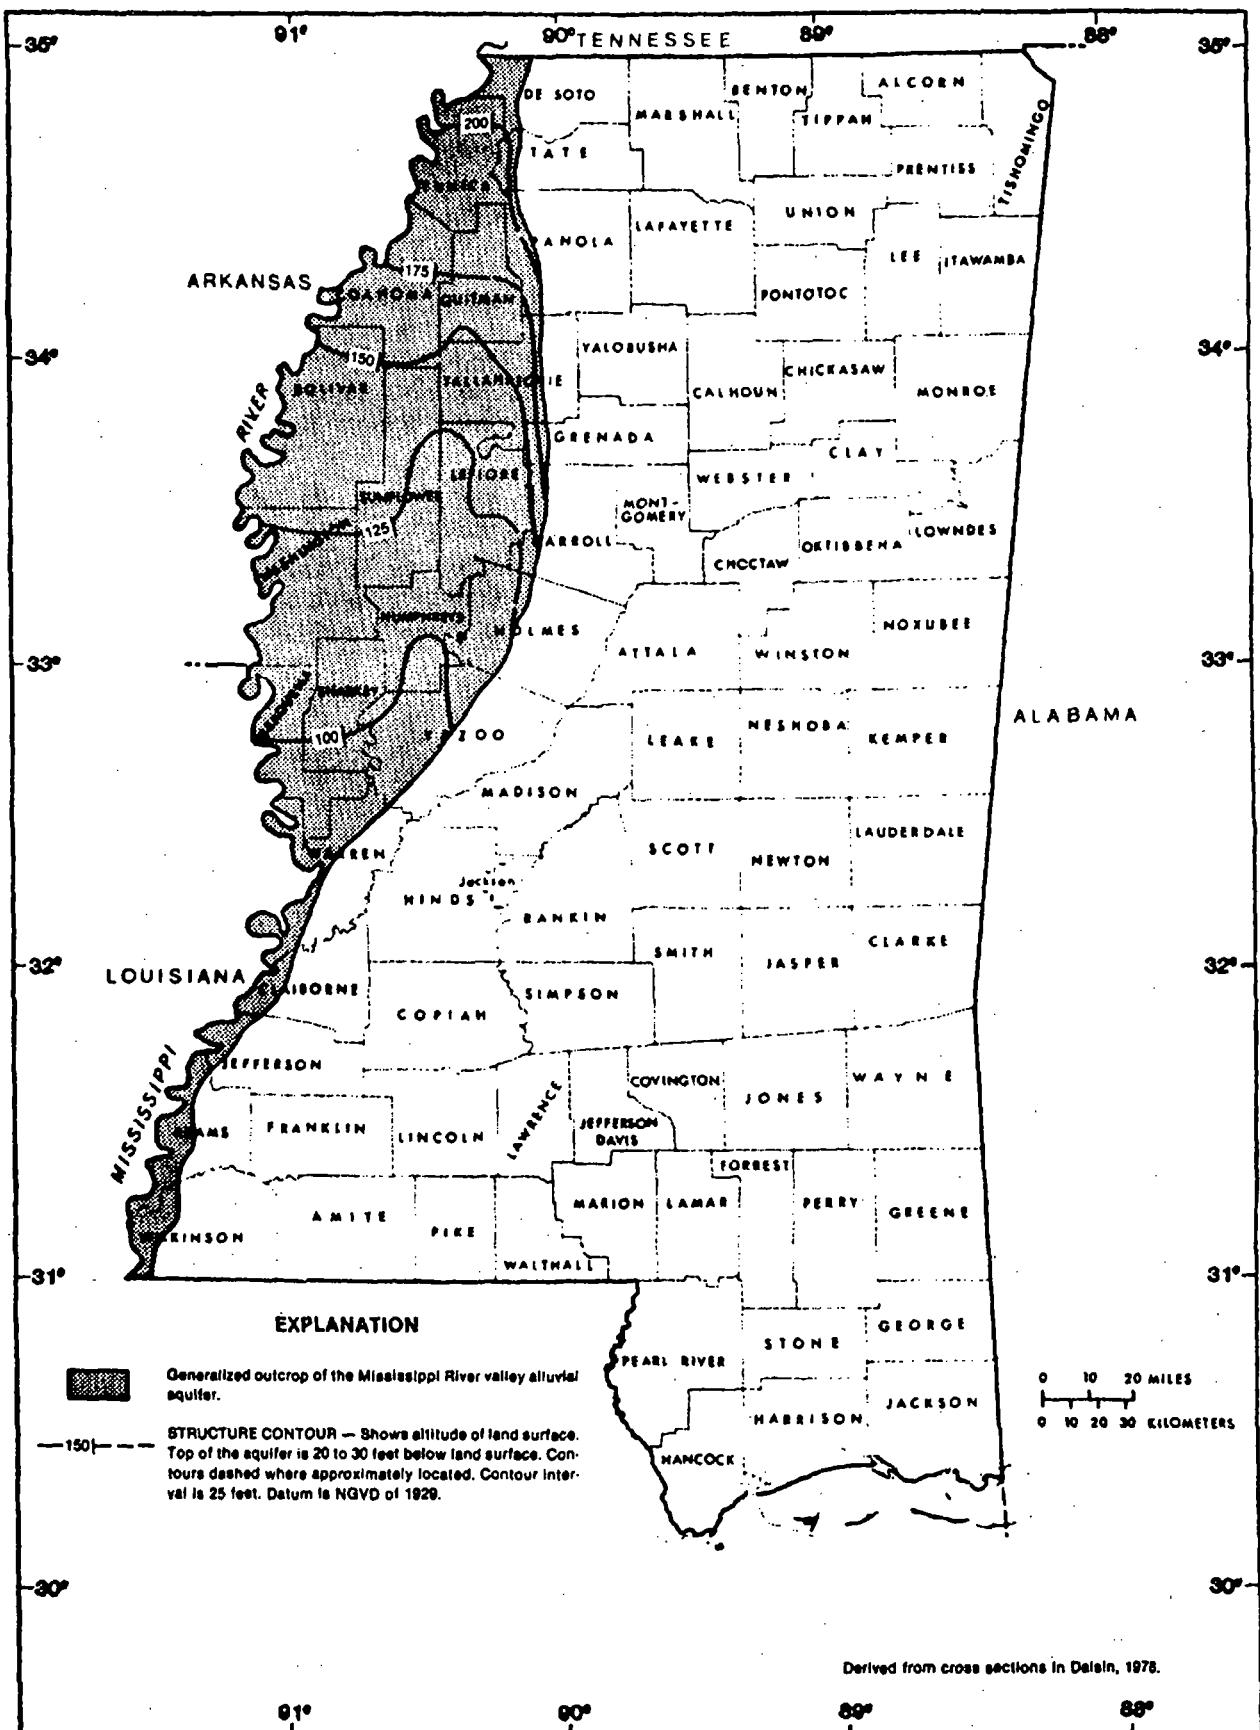

Figure 5. — Configuration of the top of the Mississippi River valley alluvial aquifer.

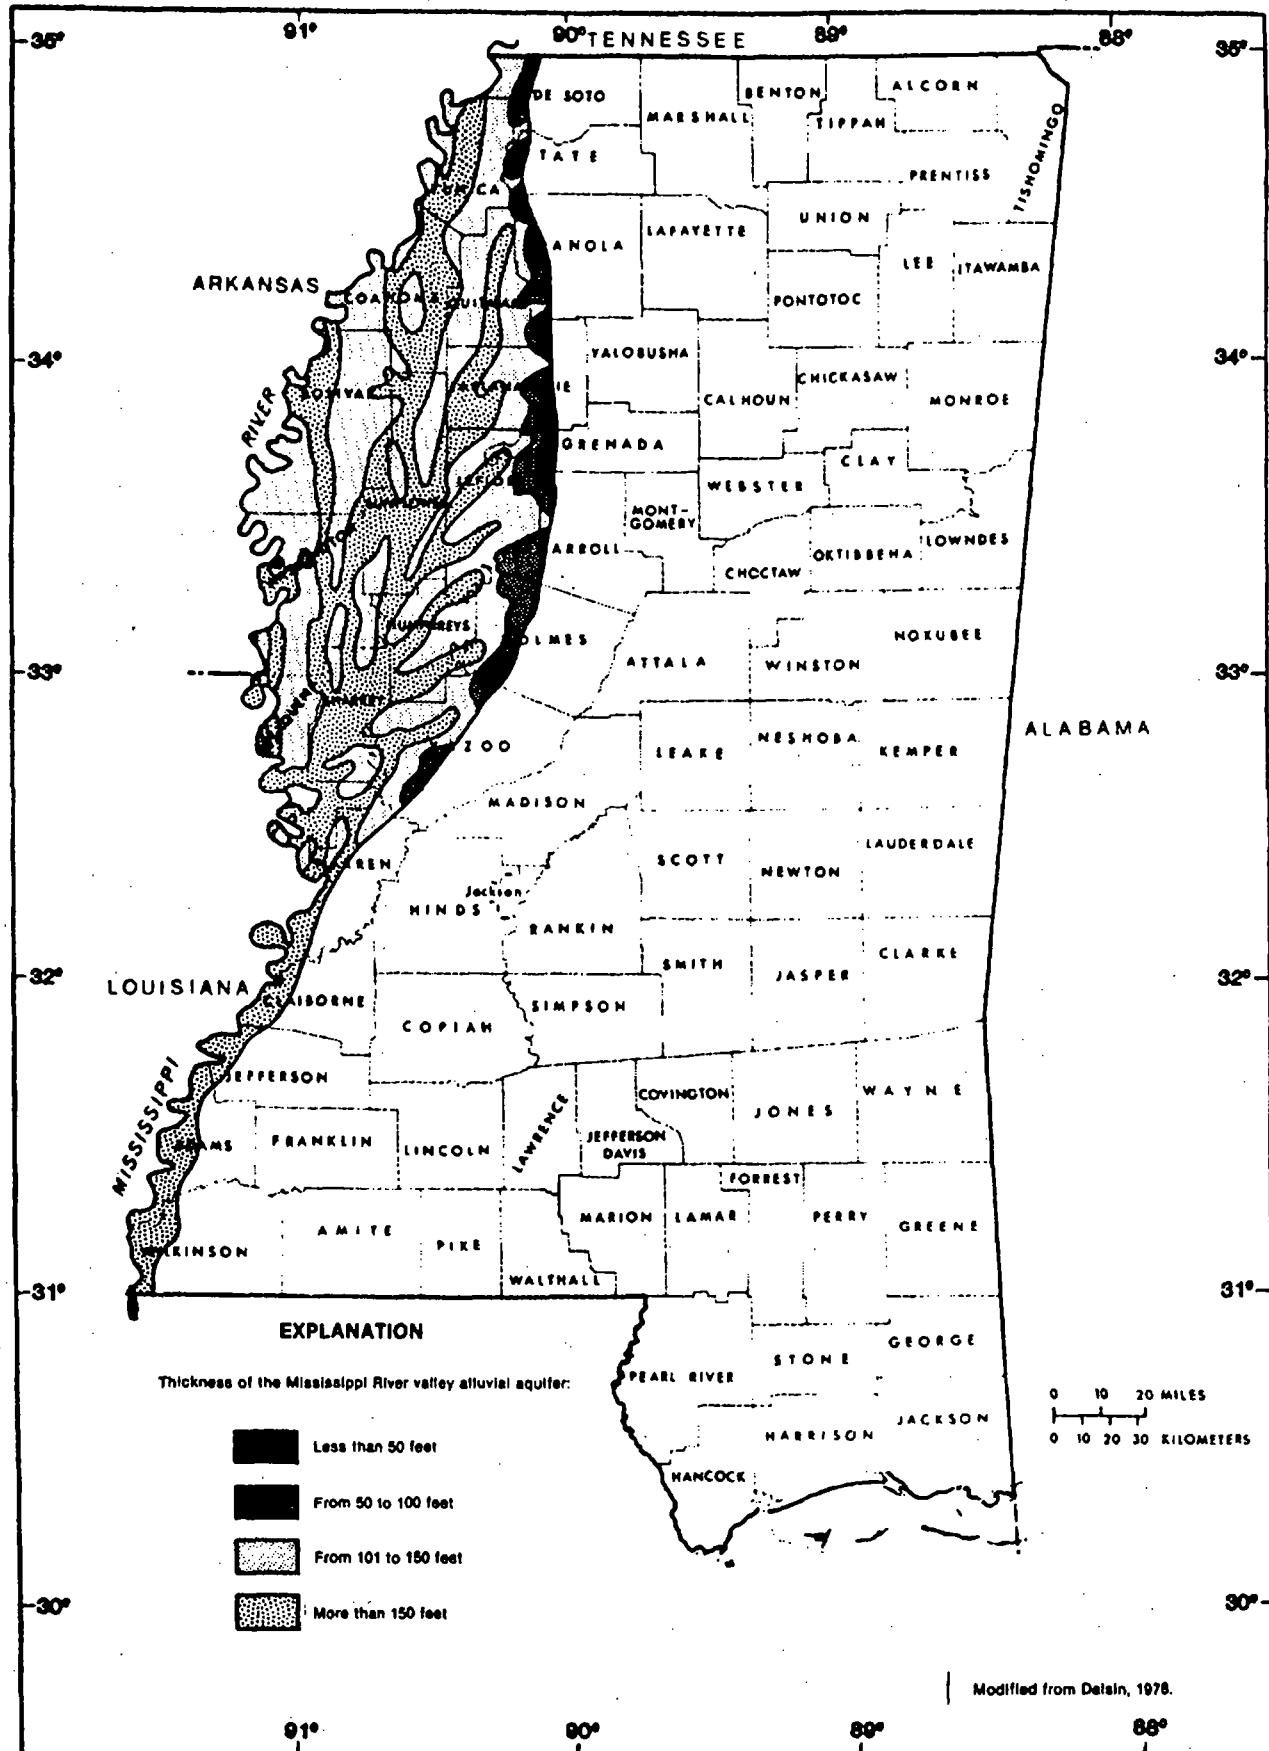

Figure 6. — Thickness of the Mississippi River valley alluvial aquifer.

### Sparta Aquifer System

The Sparta aquifer system crops out in a curving band from Marshall to Holmes to Clarke County (fig. 20). In the northwest it subcrops beneath the alluvial aquifer and loess deposits. Figures 20 and 21 show structure contours on the base and top of the aquifer system, respectively. The Sparta dips to the west at about 20 ft/mi in the northwest, and it dips to the southwest at about 35 ft/mi in the south. The Sparta has been uplifted by the Jackson and Tinsley domes. The Sparta thickens downdip and exceeds 800 feet in thickness in the southwest (fig. 22).

The Sparta Sand is composed of rounded, well-sorted quartz grains in two or three thick beds separated by beds of clay. It contains more sand relative to overall thickness than any other aquifer in the state. To the northwest near Memphis, Tennessee, it combines with underlying sand beds of the Claiborne Group and is known as the Memphis aquifer.

Water levels in the Sparta range from 450 to 100 feet above sea level decreasing downdip from the outcrop (fig. 23). In the confined part of the aquifer, the water levels have been declining 1 to 2 ft/yr except near Jackson where, due to heavy pumping, the declines are at least 3 ft/yr. Recharge to the aquifer is by rainfall on the outcrop and in the northwest by infiltration from the overlying alluvial aquifer. Water moves downdip, except near areas of heavy pumping. Except in the northwest the Sparta is isolated by the overlying Cook Mountain formation and the underlying Zilpha Clay.

Aquifer test results indicate transmissivities of 330 to 13,000 ft<sup>2</sup>/d, hydraulic conductivities of 6 to 130 ft/d, and specific capacities ranging from 1 to 46 (gal/min)/ft of drawdown (Newcome, 1976).

The Sparta is utilized by industrial, municipal, and domestic users. The deepest wells are 1,400 feet deep and yields of 100 to 300 gal/min are readily available, although much greater yields are possible.

Water in the Sparta is a soft sodium-bicarbonate type, which is acidic in the outcrop area and the northern quarter of the area but alkaline elsewhere. It is commonly high in iron in the east and is high in fluoride and colored downdip near the freshwater limit. Figure 20 shows the limits of fresh, slightly saline, and moderately saline water in the Sparta. Downdip in the southeast, the formation contains little sand and is not considered an aquifer.

Natural gas has been found in small amounts in the Sparta, and lignite is available in the north in outcrop and subcrop areas. In the southwest the Sparta has been used for disposal of oil field wastes, sometimes in areas in which the water has less than 10,000 mg/L dissolved solids (Bicker, 1972).

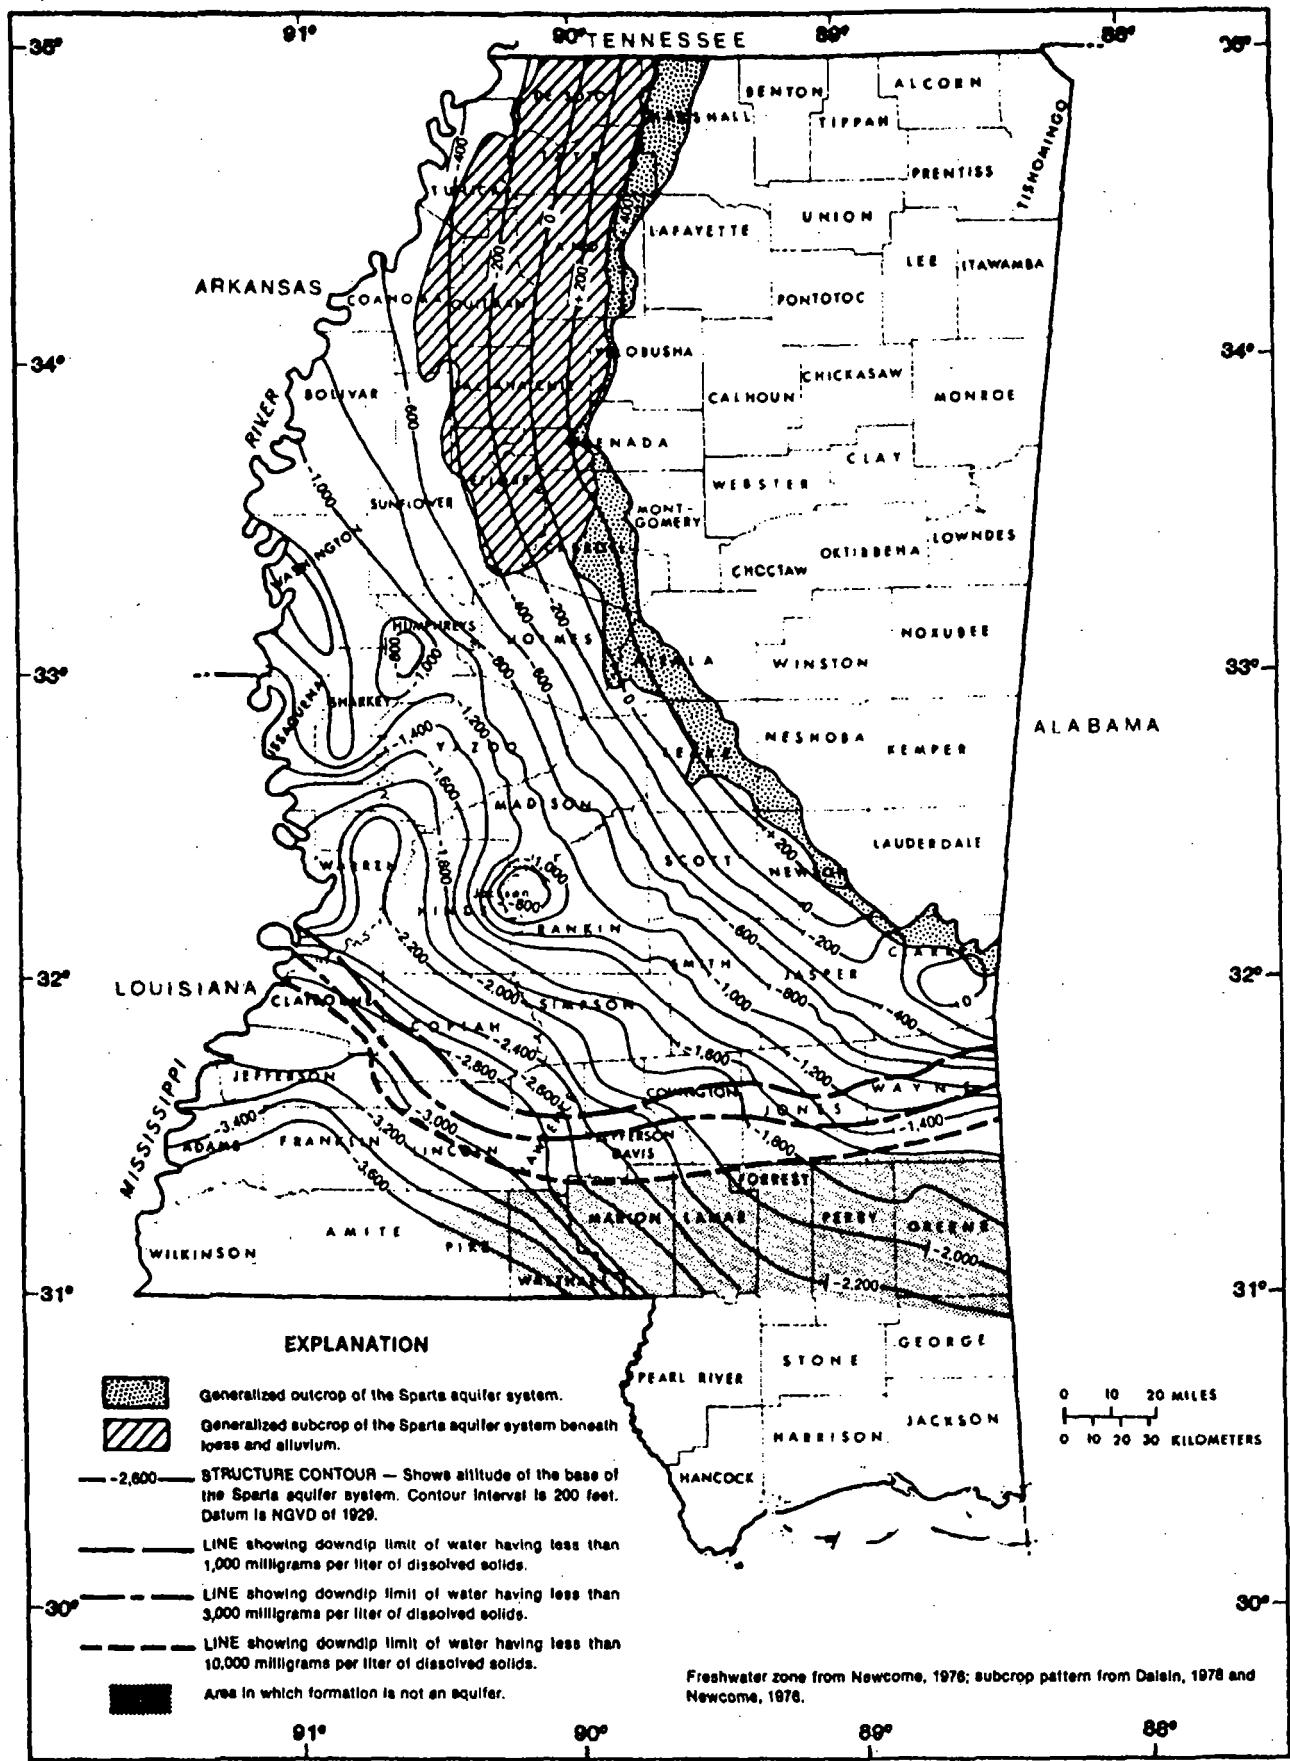

Figure 20. — Configuration of the base of the Sparta aquifer system.

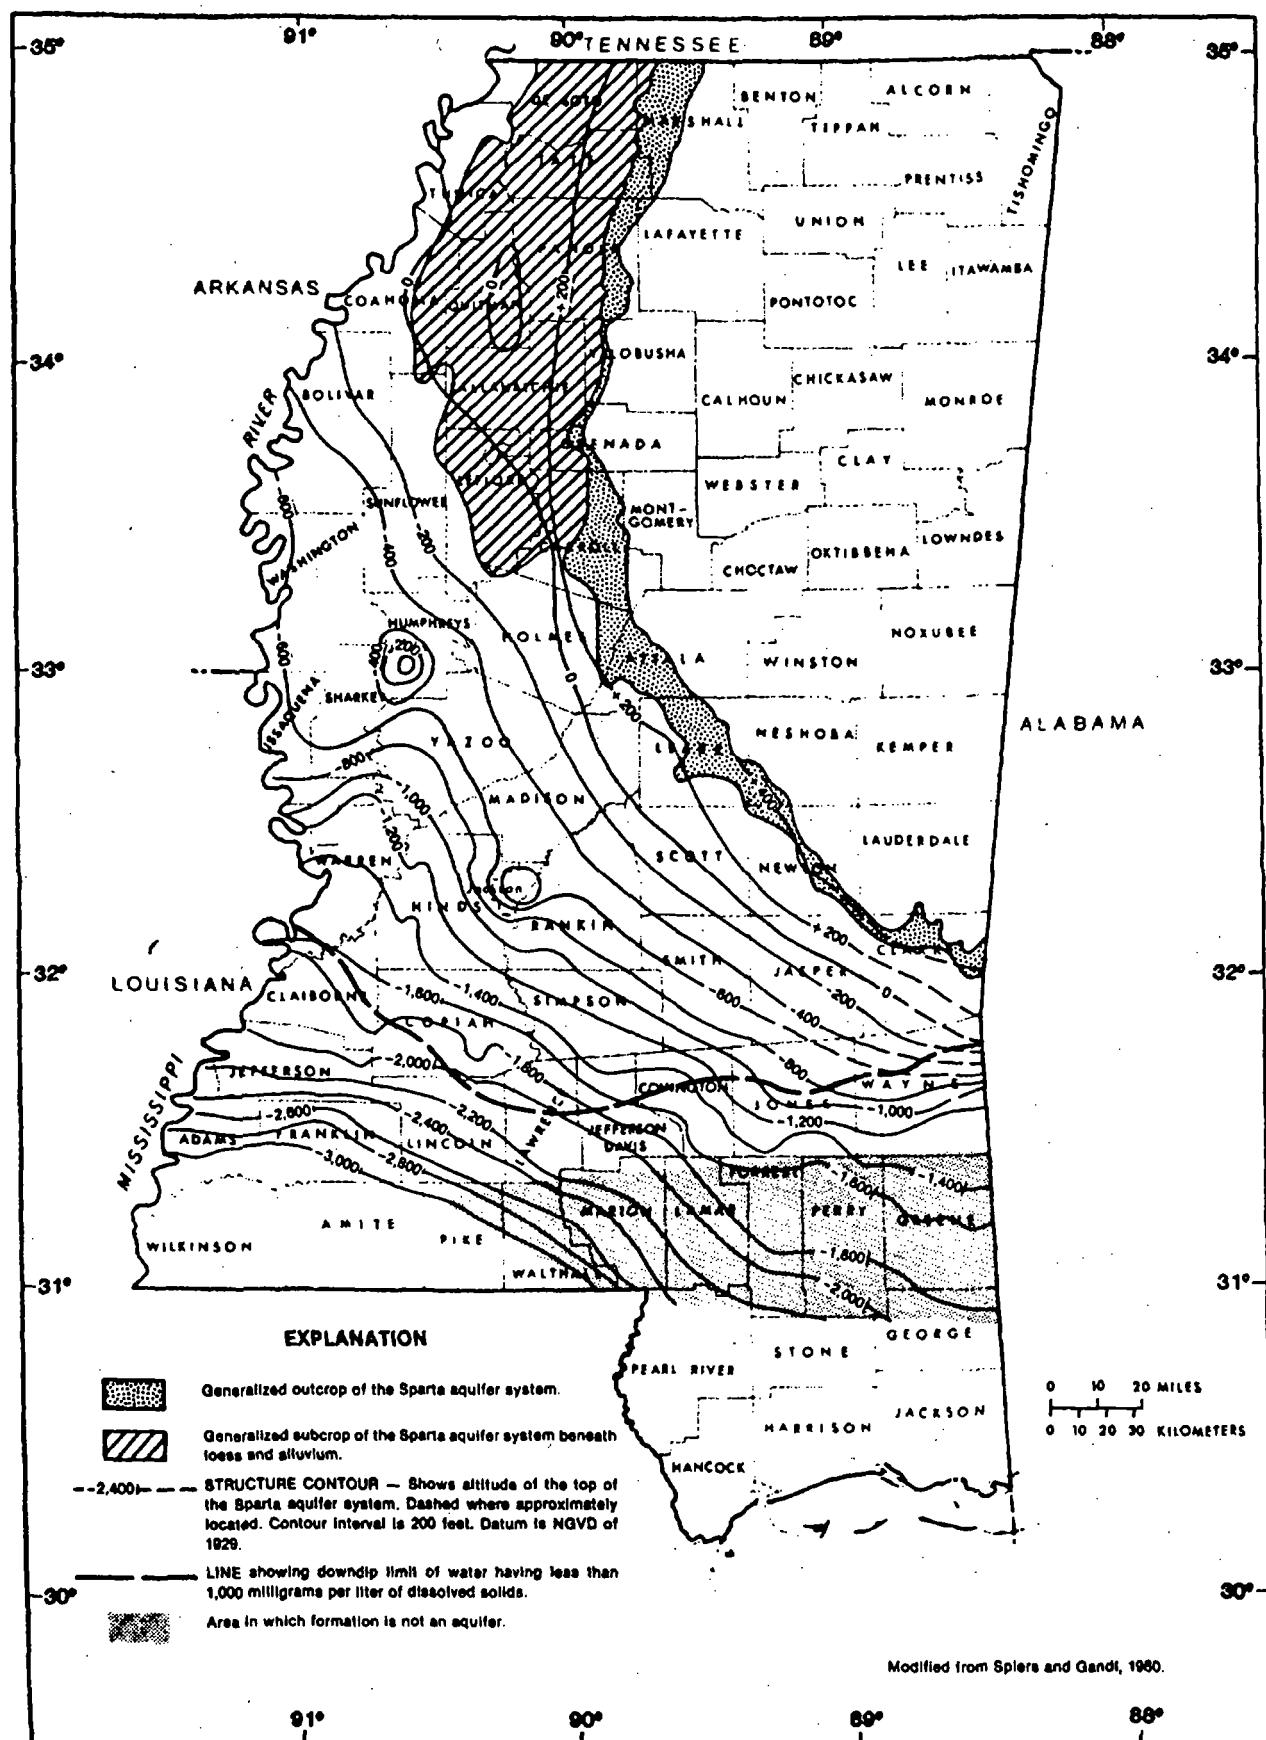

Figure 21. — Configuration of the top of the Sparta aquifer system.

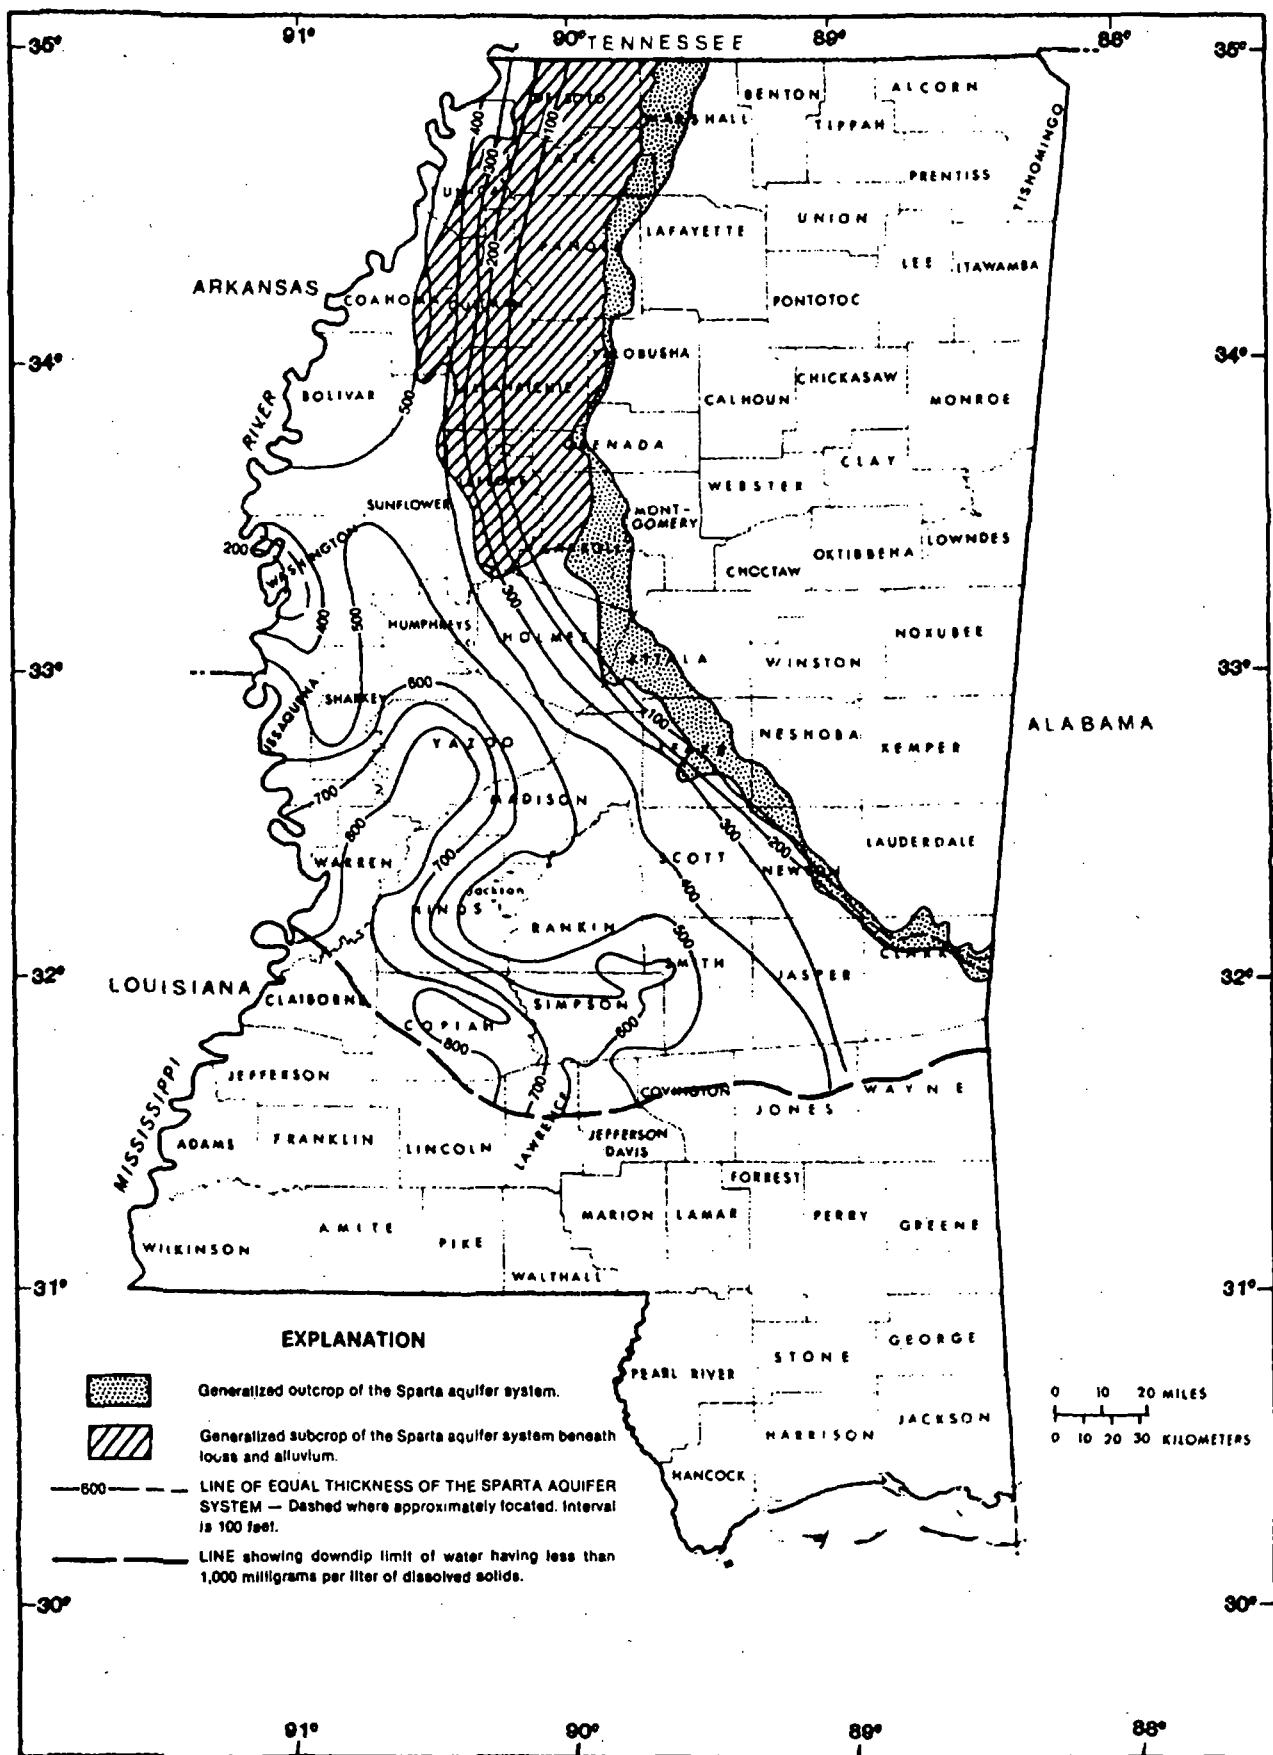

Figure 22. — Thickness of the Sparta aquifer system.

### Meridian-Upper Wilcox Aquifer

The Meridian-upper Wilcox aquifer crops out in a narrow curving band from Benton County in the north to Montgomery and then to Lauderdale County (fig. 28). The aquifer consists of the Meridian Sand Member of the Tallahatta Formation and the uppermost sand beds of the underlying Hatchetigbee Formation of the Wilcox Group. They are regarded as one aquifer, because they are hydraulically connected. The structure contours on the base and top of the aquifer are shown in figures 28 and 29. The aquifer dips to the west and southwest at 28 to 40 ft/mi, thickening downdip to over 300 feet in the freshwater section (fig. 30).

The Meridian Sand Member is a massive unit consisting of fine-to-coarse micaceous sand. The upper Wilcox aquifers consist of irregular beds of fine-to-medium sand in the central and southern areas of occurrence and a less permeable sandy clay in the northern part of the state. The aquifer is separated from the overlying Winona-Tallahatta aquifer by the Basic City Shale Member, except where the shale's sandy. It's separated from the middle Wilcox aquifer by a several clay beds.

Water levels in the Meridian-upper Wilcox aquifer are high near the area of outcrop. In some areas of the state, particularly in the alluvial plain, water levels are above ground level, resulting in flowing wells (fig. 31). Water levels in the confined part of the aquifer have been declining by about 1 ft/yr, but flowing wells are still present in places.

Recharge is by rainfall on the outcrop. Water movement in the aquifer is downdip, particularly towards an area of large withdrawal in Leflore and Sunflower Counties. More than 15 aquifer tests indicate transmissivities of 150 to 17,400 ft<sup>2</sup>/d, hydraulic conductivities of 9 to 110 ft/d, and specific capacities of 0.7 to 29 (gal/min)/ft of drawdown (Boswell, 1976b).

Municipalities are the main users of water from the Meridian-upper Wilcox aquifer. The highest yield reported is 2,800 gal/min and the deepest wells are around 2,000 ft deep. Increased use of the aquifer will increase the rate of water-level declines, but levels are high enough that this will not be a problem in most locations; the Meridian-upper Wilcox can supply many more users.

Water in the deeper part of the aquifer is of a soft sodium-bicarbonate type and in some areas is colored. The water is corrosive due to low pH in the northern part of the area and in shallow parts of the aquifer near the outcrop. The downdip limits of fresh, slightly saline, and moderately saline water are shown in figure 28.

The Meridian-upper Wilcox aquifer may become contaminated near the limit of freshwater by heavy pumping resulting in upward movement of saline water into the freshwater zone (Boswell, 1976b). Injection wells have contaminated areas in the freshwater zone and in zones containing less than 10,000 mg/L dissolved solids in Jasper County (Bicker, 1972).

## MISSISSIPPI EMBAYMENT AQUIFER SYSTEM

### INTRODUCTION

The Mississippi embayment aquifer system is the most extensive aquifer system in Segment 5, and parts of the system are discussed in Chapters C,D,G, and K (fig. 65) of this Atlas. The system underlies most of the East and West Gulf Coastal Plains and the Mississippi Alluvial Plain Sections of the Coastal Plain Province. The Mississippi embayment aquifer system merges eastward in Mississippi and in Alabama with the Pearl River aquifer that is part of the Southeastern Coastal Plain aquifer system (see Chapter G of this Atlas) and merges westward with the Coastal uplands aquifer system in Texas and Oklahoma (see Chapter E of this Atlas). A small area of equivalent rocks in southwestern Arkansas and northwestern Louisiana has been mapped as part of the Texas coastal uplands aquifer system in some reports but is considered to be part of the Mississippi embayment aquifer system in this Atlas.

The Mississippi embayment aquifer system extends eastward from Arkansas to northwestern Mississippi and comprises six aquifers that crop out as an arcuate band of poorly consolidated to unconsolidated, bedded sand, silt and clay (fig. 66). Geologic units of the aquifer system range from Late Cretaceous to middle Eocene in age. In southern Mississippi and central Louisiana, an extensive, thick, clay confining unit, the Vicksburg-Jackson confining unit, separates the Mississippi embayment aquifer system from the overlying Oligocene and younger water-yielding strata of the coastal lowlands aquifer system. In the embayed part of the Gulf Coastal Plain of eastern Arkansas, northeastern Louisiana, and northwestern Mississippi, the southward-dipping strata of the Mississippi embayment aquifer system are hydraulically connected to the Mississippi River Valley alluvial aquifer.

The geologic formations and groups that compose the Mississippi embayment aquifer system thicken greatly in southern Mississippi and Louisiana (fig. 67) where large volumes of sediment were deposited by streams that emptied into the ancestral Gulf of Mexico. The Mississippi embayment aquifer system ranges in thickness from a featheredge to more than 6,000 feet (fig. 67). The aquifer system thickens eastward and westward from its updip limits toward the axis of the Mississippi Embayment. The aquifer system is thickest in south-central Louisiana and southwestern Mississippi. Three of the system's six aquifers, the upper and the middle Claiborne and the lower Claiborne-upper Wilcox aquifers, become increasingly clayey and pinch out to the south (fig. 68). Some of the clayey confining units pinch out northward as they become increasingly sandy and more permeable.

A different perspective of the geologic and hydrogeologic units that make up the aquifer system is shown in a section that crosses the central part of the Mississippi Embayment (fig. 69). Some of the aquifers (for example, the lower Claiborne-upper Wilcox aquifer) thicken eastward across the embayment locally, the middle Claiborne, the lower Claiborne-upper Wilcox, and the middle and the lower Wilcox aquifers are in direct hydraulic contact near the western side of the embayment.

## HYDROGEOLOGIC UNITS

The Mississippi embayment aquifer system is divided into nine hydrogeologic units-six regional aquifers and three regional confining units. Thick, regionally-extensive clay and shale confining units separate some parts of the aquifer system into distinct, regionally mappable aquifers that are largely homogeneous sand. Other parts of the aquifer system lack regional confining units, and the regional aquifers in these parts are defined on the basis of different geohydrologic characteristics. The contacts of many aquifers and confining units within the Mississippi embayment aquifer system conform well to the contacts of geologic units (fig. 70). For example, the Midway confining unit coincides exactly with the different geologic formations that compose the Midway Group, and the upper Claiborne aquifer is identical to the Cockfield Formation. For some hydrogeologic units, however, particularly those that include rocks of the Claiborne Group, there is little or no equivalency with geologic units. The conformance of aquifers and confining units with geologic units also departs markedly as the Mississippi embayment aquifer system merges eastward with the Southeastern Coastal Plain aquifer system, which is described in Chapter G of this Atlas.

The extensive Jackson-Vicksburg confining unit is formed by massive clay beds and separates the Mississippi embayment system from the overlying coastal lowlands aquifer system. The Midway confining unit within the Mississippi embayment aquifer system also consists of massive clay beds and separates the aquifers in sediments of Tertiary age from underlying aquifers of rocks of Cretaceous age. Although the uppermost aquifers of the Mississippi embayment aquifer system, the upper and the middle Claiborne aquifers, are bounded above and below by confining units in most places, the lower Claiborne-upper Wilcox aquifer and the middle and the lower Wilcox aquifers are not separated by confining units. Sandy strata of the Wilcox Group are more heterogeneous than other rocks of Tertiary age and consist of a highly variable sequence of massive to thinly bedded sand and thin clay beds that are part of the three aquifers. The middle Wilcox aquifer differs considerably from overlying and underlying aquifers because its thin beds of sand and clay result in lower hydraulic conductivity than that of the massive, more permeable strata that lie above and below it.

Of the six aquifers contained within the Mississippi embayment aquifer system, the middle Claiborne aquifer is the most heavily used. Consequently, the description of the Mississippi embayment aquifer system in this chapter principally focuses on the hydrogeologic, hydraulic, and hydrochemical characteristics of the middle Claiborne aquifer. The McNairy-Nacatocah aquifer of this system also is described because the ground-water flow system is quite different from that of the other aquifers in this aquifer system.

## MIDDLE CLAIBORNE AQUIFER

The middle Claiborne aquifer comprises mostly the Sparta Sand but also includes the Memphis Sand in the northern part of the Mississippi Embayment. In this area, the Memphis Sand is equivalent to the Sparta Sand, the Cane River Formation, and the Carrizo Sand/Meridan Sand Member of the Tallahatta Formation (fig. 70). The aquifer is thickest in a large area of east-central Louisiana and southwestern Mississippi, and in a smaller area of southeastern Arkansas (fig. 71). Although its thickness is greater than 1,000 feet in Louisiana and Mississippi, the aquifer largely contains water with more than 1,000 milligrams per liter dissolved solids. Such highly mineralized water is considered to be unsuitable for most purposes. In most areas where water in the middle Claiborne aquifer contains smaller concentrations of dissolved solids, the thickness of the aquifer generally ranges from 200 to 800 feet.

Confining units separate the middle Claiborne aquifer from overlying and underlying aquifers in most places. These confining units comprise prodelta and marine shelf deposits of clay, mud, marl, and shale. The lower Claiborne confining unit (the Cane River Formation) which underlies the middle Claiborne aquifer, and the middle Claiborne confining unit (the Cook Mountain Formation), which overlies the aquifer, were deposited as a result of widespread marine invasions that interrupted progradation of clastic sediments into the Gulf Coast Basin. Clay and shale of the lower Claiborne confining unit coarsens northward and grades to sandy channel sediments (the Winona Sand and the Tallahatta Formation) deposited in a coastal margin delta system. The predominantly marine

clay facies of the lower Claiborne confining unit thus changes to an updip sand facies that forms part of the middle Claiborne aquifer. In Arkansas and northernmost Mississippi, where the lower Claiborne confining unit is missing, the middle Claiborne aquifer and the lower Claiborne-upper Wilcox aquifers function as a single aquifer, which is known locally as the Memphis aquifer.

### Relation Between Geology And Permeability

Basinwide changes in geologic facies have been shown in preceding sections of this chapter to be a principal factor that controls the hydraulic character of the surficial and the coastal lowlands aquifer systems. A similar relation exists for the Mississippi embayment aquifer system. Aquifers of the Mississippi embayment aquifer system consist of an interbedded sequence of poorly consolidated fluvial, deltaic, and marine deposits in which diagenesis or postdepositional geochemical processes have not greatly altered the original pattern of permeability. The hydraulic conductivity of the unconsolidated to poorly consolidated sediments that compose the aquifers of the Mississippi embayment aquifer system does not appear to have been greatly reduced by cementation or compaction. Consequently, the distribution of hydraulic conductivity and transmissivity of the Mississippi embayment aquifer system can be inferred from maps of sediment lithofacies, if a direct correlation between sediment type and aquifer permeability is assumed.

The Sparta Sand that composes most of the middle Claiborne aquifer in Louisiana and Mississippi (fig. 72) was deposited within a constructional delta system. A constructional delta system is characterized by a large-scale complex of elongate and lobate deltas formed by rivers with large discharge and sediment loads; the delta progrades into ocean water. Constructive delta systems contain mostly fluvial and deltaic facies in which coarser sediment is concentrated in landward fluvial tributaries or meandering channels and as deltaic distributaries and delta front-sand bodies. Distributary channels that contain permeable sand are separated by less permeable interdistributary clay (fig. 54). In constructional delta systems, fluvially transported sand, silt, and clay are deposited near the coast at a rate that exceeds the rate at which they are removed by wave energy and longshore currents. The meandering fluvial channel facies is characterized by wide, uniform, multilateral sand bodies with little clay content. The distributary channel facies differs in terms of its sand content and pattern of sedimentation. Channel sand bodies within the delta plain show a distributary pattern of sedimentation and do not show extensive lateral migration. Distributary channels are effectively isolated by the weight of sandy channel sediment, which causes compactional subsidence. Eventually, channel progradation results in its overextension, and the distributary channel shifts position by abandonment and diversion of floodwaters to an area with a steeper gradient. Younger distributary channels may overlap older channels as the delta builds up thick sequences of complexly interbedded deposits.

Distributary deposits are in the middle Claiborne aquifer as elongate bodies separated by areas almost devoid of sand that represent interdistributary deposits (fig. 72). The distribution of sand in the middle Claiborne aquifer, expressed as a percentage of the total thickness of the aquifer, suggests that sand was deposited within a distributary channel facies of a constructive delta system. Distributary channels of the middle Claiborne aquifer area characterized by high concentrations of sand (50 percent or greater) that extend as narrow, slightly meandering, elongate sand bodies (fig. 73). Interdistributary deposits contain from 30 to 50 percent sand and consist primarily of silt, clay, and lignite. Distributary and interdistributary channel lithofacies grade gulfward to prodelta silt and mud, which contains small concentrations of sand (less than 30 percent). The sandy channel sediments represent the most permeable parts of the middle Claiborne aquifer in Louisiana and Mississippi. The predominant direction of the distributary channels is southward or southwestward. Comparison of sand percentage and the distribution of transmissivity in the middle Claiborne aquifer (Sparta Sand) suggests that the more transmissive parts of the aquifer correspond to its sandier parts, which are interpreted as distributary channel facies (compare figs. 72 and 74). In these areas, transmissivity is more than 13,000 feet squared per day generally and locally exceeds 27,000 feet squared per day. Less transmissive sediments appear to be associated with the interdistributary channel facies that contain smaller percentages of sand. In the poorly transmissive areas, transmissivity is reported to be less than 13,000 feet per day.

## Well Yield

The middle Claiborne aquifer is capable of yielding water to properly constructed wells at a rate that ranges from 100 to 300 gallons per minute in Louisiana and Mississippi. Wells screened in the middle Claiborne aquifer in Arkansas are reported to yield from 300 to 1,000 gallons per minute. Yields of as much as 2,000 gallons per minute are obtained in northernmost Mississippi and eastern Arkansas where the middle Claiborne aquifer merges with the lower Claiborne-upper Wilcox aquifer and is known locally as the Memphis aquifer.

## Ground-water Flow

Gravity is the principal driving force for ground-water movement within the Mississippi embayment aquifer system. Regional movement of water in the aquifer system is from aquifer recharge areas that range from 100 to 400 feet higher than the uniformly low, flat terrain of the Mississippi Alluvial Plain where water discharges. This difference in altitude provides the gravitational energy needed to drive the ground-water flow system.

Most of the precipitation that falls on the exposed part of the Mississippi embayment aquifer system is lost to streams and rivers as direct runoff, is returned to the atmosphere from plants and soil by processes of evapotranspiration, or discharges as baseflow to streams in the outcrop area. Before development of the aquifer, water that entered the deeper, regional flow system moved toward the center of the Mississippi Embayment (fig. 75). Water in the confined parts of the system was discharged by upward leakage into shallower aquifers, such as the Mississippi River Valley alluvial aquifer. Ultimately, ground water was discharged to streams and rivers that incised the shallower aquifers.

Development of the ground-water resources of the Mississippi embayment aquifer system has greatly modified the pre-development regional flow system. Large ground-water withdrawals in southern Arkansas and northern Louisiana have caused declines of the potentiometric surface and some changes in direction of regional predevelopment flow. Lows in the predevelopment potentiometric surface were located only in areas of natural ground-water discharge. The location of potentiometric lows has changed and now depressions are in areas with large withdrawals from wells. Pumping centers in northern Louisiana and southern Arkansas were the major sites of regional ground-water discharge from the middle Claiborne aquifer in 1980 (fig. 76). Within the middle Claiborne aquifer, large withdrawals have resulted in a long-term decline in water levels, which locally exceeds 100 feet, and have created cones of depression in several places. Declines in the potentiometric surface have helped to induce greater areal recharge and recharge from incised streams in outcrop areas. Ground water removed from storage also has contributed to the long-term decline in water levels within the aquifer. Large withdrawal rates from the middle Claiborne aquifer have induced downward leakage of water into the middle Claiborne aquifer from the upper Claiborne and the Mississippi River Valley alluvial aquifers.

## Ground-water Quality

The middle Claiborne aquifer in Segment 5 contains water with less than 500 milligrams per liter dissolved solids over about one-half of its extent (fig. 77). However, the dissolved-solids concentration increases to more than 1,000 milligrams per liter where the aquifer underlies the junction of the Mississippi and the Ouachita Rivers, an area of natural ground-water discharge. The aquifer contains moderately saline water (3,000-10,000 milligrams per liter dissolved solids) in mid-dip areas, but contains brine in the deep surface.

The hydrochemical character of water in the Mississippi embayment aquifer system changes progressively downgradient in a pattern that is consistent with the pattern of other aquifer systems in clastic Coastal Plain sediments. Chemical constituents in the ground water of clastic Coastal Plain aquifer systems are controlled, in

part, by solution of the minerals in the sediments that make up the aquifers; in part, by the exchange of ions between the water and the minerals in the sediments as the water moves down the hydraulic gradient; and in part, by mixing of freshwater and saltwater in deep parts of the aquifers. The major hydrochemical facies (the dominant cations and anions) in water from the Mississippi embayment aquifer system are calcium bicarbonate, sodium bicarbonate, and sodium chloride. Other hydrochemical facies are local in extent. Calcium bicarbonate and sodium bicarbonate waters dominate the exposed and shallow subsurface areas of the middle Claiborne aquifer (fig. 78). Sodium bicarbonate water is the major type in middip subsurface areas, whereas sodium chloride water is in the deeply buried parts of the aquifer.

## MCNAIRY-NACATOCH AQUIFER

The McNairy-Nacatoch aquifer (fig. 79) comprises sand of Late Cretaceous age. The aquifer crops out or subcrops in parts of northern Mississippi and eastern and southwestern Arkansas and is the lowermost aquifer of the Mississippi embayment aquifer system. The McNairy-Nacatoch aquifer (fig. 79) extends northward into southeastern Missouri, which is described in Chapter D of this Atlas, and northeastward into western Tennessee, southern Illinois, and southwestern Kentucky, which is described in Chapter K of this Atlas. Although Missouri, Illinois, and Kentucky are not within Segment 5, the pattern of regional ground-water flow within the McNairy-Nacatoch aquifer cannot be described without also describing intersegment ground-water movement. The hydrogeology of the entire McNairy-Nacatoch aquifer is, therefore, described in this chapter.

The McNairy-Nacatoch aquifer consists of the Nacatoch Sand in Arkansas and the McNairy Sand in Mississippi. The McNairy Sand is considered to be a member of the Ripley Formation in Mississippi but is of formation rank where it extends into Tennessee and the northern part of the Mississippi Embayment. The McNairy-Nacatoch aquifer crops out as a narrow band that extends northward from Mississippi into southern Illinois and as a second narrow band in southwestern Arkansas. The aquifer subcrops beneath the Mississippi River Valley alluvial aquifer in northeastern Arkansas, southeastern Missouri, and southernmost Illinois. A confining unit separates the McNairy-Nacatoch aquifer from part of the underlying Southeastern Coastal Plain aquifer system in Mississippi, but the McNairy-Nacatoch aquifer directly overlies the Ozark Plateaus aquifer system along part of the western margin of the Coastal Plain of Arkansas and Missouri. The McNairy-Nacatoch aquifer consists of glauconitic, clayey sand deposited in a deltaic to prodeltaic environment in Arkansas and Mississippi. The aquifer is interbedded with and grades into chalk and clay as it extends southward. Deltaic deposits of sand, minor gravel, and clay compose the aquifer where it extends northward into Tennessee, southeastern Missouri, and beyond.

### Ground-water Flow

Water enters the McNairy-Nacatoch aquifer as precipitation that falls directly on the aquifer where it crops out in eastern Mississippi and the northern part of the Mississippi Embayment. Water in the aquifer moves westward from topographically high interstream areas on the northern and eastern sides of the Mississippi Embayment to a large area of regional discharge on the western side of the embayment (fig. 80). The discharge zone, which is identified by a low area of the potentiometric surface, encompasses some of the places where the McNairy-Nacatoch aquifer directly underlies the Mississippi River Valley alluvial aquifer in northeastern Arkansas and southeastern Missouri. The discharge zone also includes a large area where the McNairy-Nacatoch aquifer is confined by clay and shale of the Midway confining unit. Discharge of ground-water from the McNairy-Nacatoch aquifer does not coincide with any surface drainage features, but does correspond closely to an area subject to large ground-water withdrawals. The discharge area also is nearly coincident with the western margin of the Reelfoot Rift. Hydrochemical data and simulation of ground-water flow suggest that fractures and a tensional fault, both of which were caused by deep-seated, periodic crustal rifting in northeastern Arkansas, enhance vertical upward leakage of water from the Ozark Plateaus aquifer system and the McNairy-Nacatoch aquifer to shallower aquifers of the Mississippi embayment aquifer system.

## Ground-water Quality

The concentration of dissolved solids in water from the McNairy-Nacatoch aquifer increases in a southwesterly direction (fig. 81). Dissolved-solids concentrations are generally lowest in areas where the aquifer crops out and where it is buried only to shallow depths. In northeastern Arkansas, dissolved-solids concentrations generally are greater than 500 milligrams per liter. Concentrations of more than 1,000 milligrams per liter are present in a small area in southeastern Missouri apparently as the result of upward leakage of water from the Ozark Plateaus aquifer system. The McNairy-Nacatoch aquifer generally contains more than 3,000 milligrams per liter dissolved-solids concentration in its deepest parts. The aquifer is dominated by sodium bicarbonate water where it contains water with less than 2,000 milligrams per liter dissolved solids and by sodium chloride water where it contains water with more than 2,000 milligrams per liter dissolved solids.

## FRESH GROUND-WATER WITHDRAWALS

Fresh ground-water withdrawals from the Mississippi embayment aquifer system are estimated to be 433 million gallons per day (fig. 82). Public supply use accounts for about 52 percent of the total water withdrawn from the aquifer system, or about 224 million gallons per day. Withdrawals for domestic and commercial use were about 23 percent of the total withdrawals, or about 99 million gallons per day. Agricultural withdrawals from the Mississippi embayment aquifer system averaged about 71 million gallons per day, or about 16 percent of the total ground-water withdrawn. Industrial, mining, and thermoelectric power users withdrew about 39 million gallons per day, or about 9 percent of the total withdrawals.

More water is withdrawn from the middle Claiborne aquifer than from any other aquifer of the Mississippi embayment aquifer system. In 1980, for example, about 308 million gallons per day was withdrawn from the aquifer principally from major pumping centers (fig. 83) in the cities of Stuttgart, Pine Bluff, El Dorado, and Magnolia, Arkansas; Ruston, Jonesboro, Monroe, and Bastrop, Louisiana, and Yazoo City and Jackson, Mississippi. Large withdrawals are also made by pumping centers in the Memphis, Tennessee area (Chapter K).

- IN THE MATTER OF:**
- ) **ADMINISTRATIVE ORDER ON CONSENT FOR REMOVAL ACTION**
  - ) **RED PANTHER PESTICIDE SUPERFUND SITE**
  - ) **Clarksdale, Coahoma County, Mississippi**
  - ) **U.S. EPA Region 4 CERCLA Docket No. CER-04-2001-3766**
  - ) **Proceeding Under Sections 104, 106(a), 107 and 122 of the Comprehensive Environmental Response, Compensation, and Liability Act, as amended, 42 U.S.C. §§ 9604, 9606, 9607 and 9622**
  - ) **Respondents (see Attachment A)**

**I. JURISDICTION AND GENERAL PROVISIONS**

This Administrative Order on Consent ("Order") is entered into voluntarily by the United States Environmental Protection Agency ("EPA") and the Respondents referenced in Attachment A ("Respondents"). This Order provides for the performance of the removal action by Respondents and the reimbursement of response costs incurred by the United States in connection with the Red Panther Superfund Site ("Site") located at 550 Patton and Leflore in Clarksdale, Coahoma County, Mississippi. This order requires Respondents to conduct the removal action described herein to abate an imminent and substantial endangerment to the public health, welfare or the environment that may be presented by the actual or threatened release of hazardous substances, at or from the Site.

This Order is issued pursuant to the authority vested in the President of the United States by Sections 104, 106(a), 107, and 122 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, 42 U.S.C. §§ 9604, 9606(a), 9607, and 9622, as amended ("CERCLA"), and delegated to the Administrator of EPA by Executive Order No. 12580, January 23, 1987, 52 Federal Register 2923, and further delegated to the EPA Regional Administrators by EPA Delegation Nos. 14-14-A, 14-14-C, and 14-14-D, to the Director, Waste Management Division by EPA Region IV Delegation No. 8-14-13, and to the Chief, Emergency Response and Removal Branch, Waste Management Division by EPA Region 4 Delegations. EPA has notified the State of Mississippi ("State") of this action pursuant to Section 106(a) of CERCLA, 42 U.S.C. § 9606(a).

Respondents' participation in this Order shall not constitute or be construed as an admission of liability or of responsibility or of EPA's findings or determinations contained in

10095298

10 11 002

this Order except in a proceeding to enforce the terms of this Order. Respondents agree to comply with and be bound by the terms of this Order. Respondents further agree that they will not contest the basis or validity of this Order or its terms.

## II. PARTIES BOUND

This Order applies to and is binding upon EPA, and upon Respondents and Respondents' heirs, successors and assigns. Any change in ownership or corporate status of Respondents including but not limited to, any transfer of assets or real or personal property shall not alter Respondents' responsibilities under this Order. Respondents are jointly and severally liable for carrying out all activities required by this Order. Compliance or noncompliance by one or more Respondents with any provision of this Order shall not excuse or justify noncompliance by any other Respondents.

Respondents shall ensure that their contractors, subcontractors, and representatives receive a copy of this Order and comply with this Order. Respondents shall be responsible for any noncompliance with this Order.

## III. FINDINGS OF FACT

For the purposes of this Order, EPA finds that:

- A. The Red Panther Chemical Company Site is located in Clarksdale, Coahoma County, Mississippi. The facility occupies 6.5 acres of Normandy and Patton Street, east of the City of Clarksdale.
- B. Liquid and dry herbicides, insecticides, and fungicides were formulated at the facility between 1949 and 1996.
- C. The remains of a tank battery which stored technical grade pesticides is located west of the former formulation building.
- D. Nineteen buildings remain on the property, including the north warehouse, the south warehouse, and the office. The southern warehouse was historically used for the formulation of liquid insecticides. Current use of the facility is storage of seed and farm supplies.
- E. Before ownership by the Red Panther Chemical Company, the facility was owned by Coahoma Chemical Company, Riverside Chemical Company, and MFC Services.
- F. High concentrations of toxaphene, chlordane, and DDT has migrated off the property via drainage ditches.

- G. Chemicals used in the formulation of insecticides by Red Panther Chemical Company include: toxaphene, methyl parathion, chlorpyrifos, 2,4-D, malathion, carbaryl, diazinon, methoxychlor, disodium methanearsonate (DSMA), monosodium acid methanearsonate (MSMA), chlorothalonil, and parathion.
- H. Toxaphene contaminated soils are present on site in concentrations up to 120,000 mg./kg. DDT and its degradation products were detected in soil samples in concentrations up to 1,400 mg/kg. Arsenic was detected in soil samples in concentrations up to 339 mg/kg. Aldrin was detected in soil samples in concentrations up to 680 mg/kg. Endrin was detected in soil samples in concentrations up to 44 mg/kg. Endosulfan II was detected in soil samples in concentrations up to 42 mg/kg. Chlordane was detected in soil samples in concentrations up to 270 mg/kg. Dieldrin was detected in soil samples in concentrations up to 200 mg/kg. The sampling data indicates that a release of multiple hazardous contaminants has occurred at the site.
- I. The contamination at the Site poses a threat to public health and welfare. Elevated levels of pesticide residues have migrated off the facility via surface erosions. Occupants of the nearby facilities and area residents may be subject to exposure via direct contact and/or inhalation to elevated concentrations of pesticide residues.

#### **IV. CONCLUSIONS OF LAW AND DETERMINATIONS**

Based on the Findings of Fact set forth above, and the Administrative Record supporting this removal action, EPA has determined that:

1. The Red Panther Superfund Site is a "facility" as defined by Section 101(9) of CERCLA, 42 U.S.C. § 9601(9).
2. The contaminants found at the Site, as identified in the Finds of Fact above, include "hazardous substances" as defined by Section 101(14) of CERCLA, 42 U.S.C. § 9601(14).
3. Each Respondent is a "person" as defined by Section 101(21) of CERCLA, 42 U.S.C. § 9601(21).
4. Each Respondent may be liable under Section 107(a) of CERCLA, 42 U.S.C. § 9607(a).
5. The conditions described in the Findings of Fact above constitute an actual or threatened "release" of a hazardous substance from the Site as defined by Sections 101(22) of CERCLA, 42 U.S.C. § 9601(22).

6. The conditions present at the Site constitute an imminent and substantial endangerment to public health, welfare, or the environment. Factors that may be considered are set forth in Section 300.415(b)(2) of the National Oil and Hazardous Substances Pollution Contingency Plan, as amended, 40 CFR Part 300 ("NCP").
7. The actual or threatened release of hazardous substances at or from the Site may present an imminent and substantial endangerment to the public health, welfare, or the environment within the meaning of Section 106(a) of CERCLA, 42 U.S.C. § 9606(a).
8. The removal actions required by this Order are necessary to protect the public health, welfare, or the environment, and are not inconsistent with the NCP or CERCLA.

#### V. ORDER

Based upon the foregoing Findings of Fact, Conclusions of Law and Determinations, and the Administrative Record for this Site, it is hereby ordered and agreed that Respondents shall comply with the following provisions, including but not limited to all attachments to this Order, and all documents incorporated by reference into this Order, and perform the following actions:

##### 1. Designation of Contractor, Project Coordinator, and On-Scene Coordinator

Respondents shall perform the removal action required by this Order (themselves) or retain a contractor(s) to perform the removal action. Respondents shall notify EPA of Respondents' qualifications or the name(s) and qualification(s) of such contractor(s) within twenty (20) business days of the effective date of this Order. Respondents shall also notify EPA of the name(s) and qualification(s) of any other contractor(s) or subcontractor(s) retained to perform the removal action under this Order at least twenty-one (21) days prior to commencement of such removal action. EPA retains the right to disapprove of any, or all, of the contractors and/or subcontractors retained by the Respondents, or of Respondents' choice of itself (themselves) to do the removal action. If EPA disapproves of a selected contractor or the Respondents, Respondents shall retain a different contractor or notify EPA that it will perform the removal action itself within twenty (20) business days following EPA's disapproval and shall notify EPA of that contractor's name or Respondents and qualifications within twenty (20) business days of EPA's disapproval.

Within ten (10) days after the effective date of this Order, Respondents shall designate a Project Coordinator who shall be responsible for administration of all the Respondents' actions required by the Order. Respondents shall submit the designated coordinator's name, address, telephone number, and qualifications to EPA. To the greatest extent possible, the Project Coordinators shall be present on Site or readily available during Site

work. EPA retains the right to disapprove of any Project Coordinator named by Respondents. If EPA disapproves of a selected Project Coordinator, Respondents shall retain a different Project Coordinator and shall notify EPA of that person's name, address, telephone number, and qualifications within ten (10) business days following EPA's disapproval. Receipt by Respondents' Project Coordinator of any notice or communication from EPA relating to this Order shall constitute receipt by (all) Respondents.

EPA has designated DeLyntoneus Moore of the EPA, Region 4 Emergency Response and Removal Branch as its On-Scene Coordinator ("OSC"). Respondents shall direct all submissions required by this Order to the OSC at 61 Forsyth St., SW, Atlanta, Georgia 30303. EPA and Respondents shall have the right, subject to the immediately proceeding paragraph, to change its/their designated OSC or Project Coordinator. Respondents shall notify EPA, ten (10) business days before such a change is made. The initial notification may be orally made but it shall be promptly followed by a written notice.

2. Work to Be Performed

- A. Respondents shall provide a project schedule to EPA within thirty (30) days after receipt of this Order. Respondents shall submit a draft Phase I Work Plan of activities required to comply with this Order to EPA for review and approval within thirty (30) days of receipt of this Order. Respondents shall complete within sixty (60) days after receipt of EPA comments on the draft work plan, the following measures, which shall be undertaken at the direction of EPA through its OSC:
  1. Respondents shall submit a Final Phase I Work Plan of activities required to comply with this Order, containing the following:
    - (a) The Sampling and Analysis/Quality Assurance Project Plan shall contain all relevant information necessary to describe the sampling and analysis of on site soils. In addition, all information regarding laboratory analyses, including test methods and the Quality Assurance/Quality Control procedures to be followed must also be included in the document.
    - (b) The Field Health and Safety Plan shall provide all necessary information regarding the levels of personnel protective equipment to be used in the field and classified by discrete task to be performed. Respondents shall be responsible for ensuring that all personnel involved in field work at the site have been fully trained and certified in cleanup of hazardous waste sites, as specified under 29 CFR 1910.120. It should be noted that EPA does not "approve" the Respondents' Health and Safety Plan, but rather reviews it to ensure that all necessary elements are included, and

that the plan provides for the protection of human health and the environment.

- (c) Details of the proposed Phase I Work Plan, and methods to be employed while conducting the removal activities required by this Order. The plan should include, but not [be] limited to, a description on the equipment and personnel anticipated to be required for the project, a project performance schedule, and descriptions of likely transportation, treatment/and disposal options for categories of waste at the Site.
- (d) Subsequent to EPA's review of the Phase I work plan, EPA shall notify Respondents in writing of EPA's approval or disapproval of the work plan or any part thereof. In the event of any deficiencies and any EPA recommended modifications regarding the work plan, within ten (10) business days of receipt of notification by EPA that the work plan requires modifications and revisions, Respondents shall amend and submit to EPA a revised work plan. In the event of subsequent disapproval of the work plan, EPA retains the right to complete the work or any portion thereof pursuant to its authority under CERCLA.
- (e) Following completion of the Phase I work, a Phase II Work Plan will be submitted for EPA review and approval. The Phase II Work Plan will detail soil removal and disposal in accordance with the Performance Criteria defined herein.

B. (1) Performance Standards. The work will be performed between Tallahatchie Avenue and Highway 49 in the general area shown in Exhibit 1. The extent of investigation/work will be expanded in the event distinct migration pathways from this site are identified beyond these areas. For the purpose of this order Performance Standards will be as described in the following paragraphs. Analysis for comparison of soil conditions with Performance Standards will be conducted with composite samples. Analysis of individual aliquots will be conducted as necessary to identify potential hot spots.

- (a) Surface Soils. Surface Soil Performance Standards are applied to the top 2 feet of soil. The Performance Standard for surface soil remaining after excavation and backfill will be a 95% Upper Confidence Level estimate of the exposure domain mean concentration of each substance listed below that is less than or equal to the following concentrations: Arsenic – 23 ppm; Toxaphene – 39 ppm; Dieldrin- 3 ppm; Total Chlorinated pesticides- 100 ppm.

10 11 0007

The exposure domain for surface soils outside of the Red Panther Property line is 0.25 acres or as defined in the work plan for the ditches. The exposure domain for surface soils in the Red Panther property line is shown in Exhibit 1.

- (b) Subsurface Soils. Subsurface Soil Performance Standards are applied to the soil from 2 to 10 feet below the ground surface. The Performance standard in subsurface soils will be a 95% Upper Confidence Level estimate of the mean concentration of each substance listed below over the vertical and spatial exposure domain that is less than or equal to the following concentrations: Arsenic - 270 ppm; Toxaphene -220 ppm; Dieldrin— 15 ppm.

The exposure domains for subsurface soils are shown on Exhibit 2.

- (c) The Phase I Work Plan shall provide for excavation and removal of surface soils in drainage ditches between the Red Panther property boundaries and Route 49 sufficient to meet the surface soil performance standards. The removal shall be confirmed by confirmation samples as specified in the Phase I Work Plan.
- (d) The work plan shall provide for temporary measures as appropriate to control potential exposures to soils within the site.
- (e) The Phase I Work Plan shall provide for characterization of on-site conditions sufficient to identify surface and subsurface soils that may require further action to protect human health and the environment. The characterization will be the basis for a Phase II Work Plan for removal or treatment of:
- i. surficial on-site soils (0-2 feet below ground surface) necessary to achieve surface soil performance standards;
  - ii. Investigation or removal of grids for hot spots will be conducted at any grid where a composite sample is above 190 mg/kg arsenic, 260 mg/kg toxaphene and 18 mg/kg dieldrin. Investigation, if conducted in lieu of removal will consist of analysis of individual aliquots. If the investigation identifies surficial hot spots, (500 square feet or greater) which exceed a value of 954 mg/kg arsenic, 1300 mg/kg toxaphene and 89 mg/kg dieldrin, then those areas will be included in the removal.
  - iii. subsurface on-site soils (2-10 feet below ground surface) necessary to achieve subsurface soil performance standards.

- (f) Respondents shall install a Cartesian coordinate grid system throughout the Site. The grid layout and size will be established in the Phase I Work Plan.
- (g) A sampling scheme shall be designed to uniformly distribute samples along the entire length and width of the railroad spur.
- (h) A sampling scheme shall be designed to uniformly distribute samples along the entire length and width of the drainage ditches.

The Phase II Work Plan shall be submitted and shall be subject to the same review process set forth herein for the Phase I Work Plan.

- C. Any excavated material removed during Phase I will either be stockpiled and secured on Red Panther property pending management under Phase II or transported and disposed of in a RCRA-approved subtitle C or subtitle D disposal facility as appropriate. Respondents shall characterize for disposal, utilizing TCLP analyses, the soils removed and stockpiled pursuant to this Order.
- D. A minimum of seven (7) days prior to implementation of soil disposal, written notice shall be given to EPA concerning all phases of disposal, including the name and address of the facility or facilities to which the hazardous substances are to be transported.
- E. Post-excavation sampling will be conducted in the excavated areas to assure that performance standards have been achieved.
- F. Respondents shall provide adequate verification and documentation, including copies of manifests, regarding all contaminated materials transported to a waste disposal facility in compliance with RCRA Subtitle C or D as appropriate.
- G. Respondents shall utilize a dust suppression method during active work to minimize the potential for contaminated dust particles to migrate from the facility.
- H. The Respondents shall provide for the decontamination of the transport vehicles, before departure from the facility.
- I. Respondents shall provide for the collection and treatment/disposal of all contaminated waters, rinses, and sediment accumulated as a result of the decontamination operation.
- J. To the extent they are legally able to do so, Respondents shall flag and sign the site and make best efforts to secure the ditches, any stockpiled materials, and areas of active work in such a manner as to prevent or minimize the access of unauthorized pedestrian traffic.

- K. Upon request by EPA, Respondents shall provide EPA with an opportunity to split samples of any samples collected in accordance with the requirements of this Order.
- L. All activities performed pursuant to this Order shall be under the direction and supervision of a qualified professional engineer or other qualified professional with expertise and experience in hazardous waste site cleanup. Respondents shall notify EPA as to the identity of such engineer or other professional and of any contractors and subcontractors to be used in the implementation of this Order in advance of their work at the Site. EPA reserves the right to disapprove of any engineer or other professional selected by the Respondents.
- M. Respondents, or their designee, shall use quality assurance, quality control, chain-of-custody, and manifest procedures in accordance with applicable EPA guidance throughout all activities. Respondents shall consult with EPA in planning, sample collection, analysis, and transportation and disposal of the hazardous substances at the Site. Respondents shall provide a quality control report to EPA which certifies that all activities have been performed as approved by EPA.
- N. Respondents or their designee shall preserve all site records developed pursuant to the implementation of this Order for a period of at least six (6) years following completion of all work conducted by Respondents pursuant to this Order.
- O. Notwithstanding compliance with the terms of this Order, Respondents may be required to take further actions as necessary to abate the endangerment posed by conditions within the scope of this Order at the Site.
- P. In the event that the OSC determines that activities implemented by Respondents are not in compliance with this Order or that any other circumstances or activities are creating an imminent and substantial endangerment to the public health or welfare or the environment, the OSC may order Respondents to halt further implementation of this Order for such period of time as is necessary to abate the endangerment. Any OSC verbal order will be followed by the OSC's written notice describing the event and conditions to be addressed. In addition EPA may carry out all activities pursuant to this Order and such other activities as it deems necessary and consistent with the NCP.

### 3. Access to Property and Information

Respondents shall provide, and/or make best efforts to obtain, access to the Site and off-Site areas to which access is necessary to implement this Order, and provide access to all records and documentation related to the conditions at the Site and the actions conducted pursuant to this Order. Such access shall be provided to EPA employees, contractors, agents, consultants, designees, and representatives. Such access provided and/or obtained by Respondents shall permit them to move freely on-Site and at appropriate off-Site areas

10 11 0010

in order to conduct actions which EPA determines to be necessary. Respondents shall submit to EPA, upon request, the results of all sampling or tests and all other data generated by Respondents or their contractors, or on the Respondents' behalf during implementation of this Order.

Where action under this Order is to be performed in areas owned by or in possession of someone other than Respondents, Respondents shall use their best efforts to obtain all necessary access agreements within ten (10) days after the effective date of this Order, or as otherwise specified in writing by the OSC. Respondents shall immediately notify EPA if after using their best efforts they are unable to obtain such agreements. Respondents shall describe in writing their efforts to obtain access. EPA may then assist Respondents in gaining access, to the extent necessary to effectuate the response actions described herein, using such means as EPA deems appropriate. Respondents shall reimburse EPA for all costs and attorney's fees incurred by the United States in obtaining such access.

#### 4. Record Retention, Documentation, Availability of Information

Respondents or their designee shall preserve all documents and information relating to work performed under this Order, or relating to the hazardous substances found on or released from the Site, for ten (10) years following completion of the removal actions required by this Order. At the end of this ten year-period and thirty (30) days before any document or information is destroyed, Respondents shall notify EPA that such documents and information are available to EPA for inspection, and upon request, shall provide the originals or copies of such documents and information to EPA. In addition, Respondents shall provide documents and information retained under this section at any time before expiration of the ten year-period at the written request of EPA.

Respondents may assert a business confidentiality claim pursuant to 40 CFR § 2.203(b) with respect to part or all of any information submitted to EPA pursuant to this Order, provided such claim is allowed by Section 104(e)(7) of CERCLA, 42 U.S.C. § 9604(e)(7). Analytical and other data specified in Section 104(e)(7)(F) of CERCLA shall not be claimed as confidential by the Respondents. EPA shall disclose information covered by a business confidentiality claim only to the extent permitted by, and by means of the procedures set forth at, 40 CFR Part 2, Subpart B. If no such claim accompanies the information when it is received by EPA, EPA may make it available to the public without further notice to Respondents.

#### 5. Off-Site Shipments

All hazardous substances, pollutants, or contaminants removed off-Site pursuant to this Order for treatment, storage, or disposal shall be treated, stored, or disposed of at a facility in compliance, as determined by EPA, pursuant to Section 121(d)(3) of CERCLA, 42 U.S.C. § 9621(d)(3), and the off-site rule at 40 CFR 300.440. EPA will provide information on the acceptability of a facility under Section 121(d)(3) of CERCLA and 40 CFR 300.440.

#### 6. Compliance With Other Laws

Respondents shall perform all actions required pursuant to this Order in accordance with all applicable local, state, and federal laws and regulations except as provided in CERCLA Section 121(e) and 40 CFR Section 300.415(i). In accordance with 40 CFR Section 300.415(i), all on-Site actions required pursuant to this Order shall, as determined by EPA, attain applicable or relevant and appropriate requirements ("ARARs") under federal environmental or state environmental or facility siting laws. (See "The Superfund Removal Procedures: Guidance on the Consideration of ARARs During Removal Actions," OSWER Directive No. 9360.3-02, August 1991).

#### 7. Emergency Response and Notification of Release.

If any incident, or change in Site conditions, during the actions conducted pursuant to this Order causes or threatens to cause an additional release of hazardous substances from the Site or an endangerment to the public health, welfare, or the environment, Respondents shall immediately take all appropriate actions. Respondents shall take these actions in accordance with all applicable provisions of this Order, including, but not limited to the Health and Safety Plan, in order to prevent, abate or minimize such release or endangerment caused or threatened by the release. Respondents shall also immediately notify the OSC at 404/562-8756 or, in the event of his/her unavailability, shall notify the Region 4 duty officer at (404) 562-8700 of the incident or Site conditions. If Respondents fail to respond, EPA may respond to the release or endangerment and reserve the right to pursue cost recovery.

In addition, in the event of any release of a hazardous substance from the Site, Respondents shall immediately notify EPA's OSC and the National Response Center at telephone number (800) 424-8802. Respondents shall submit a written report to EPA within seven (7) days after each release, setting forth the events that occurred and the measures taken or to be taken to mitigate any release or endangerment caused or threatened by the release and to prevent the reoccurrence of such a release. This reporting requirement is in addition to, not in lieu of, reporting under CERCLA Section 103(c) and Section 304 of the Emergency Planning and Community Right-To-Know Act of 1986, 42 U.S.C. §§ 11001 et seq.

#### VI. AUTHORITY OF THE EPA ON-SCENE COORDINATOR

The OSC shall be responsible for overseeing the Respondents' implementation of this Order. The OSC shall have the authority vested in an OSC by the NCP, including the authority to halt, conduct, or direct any work required by this Order, or to direct any other removal action undertaken at the Site. Absence of the OSC from the Site shall not be cause for stoppage of work unless specifically directed by the OSC.

## VII. REIMBURSEMENT OF COSTS

Within sixty (60) days after the effective date of this Section VII of the order as provided for in Section XX, Respondents shall pay \$124,669.50, in the manner detailed below, for reimbursement of past response costs paid by the United States. Past response costs are all costs, including, but not limited to, direct and indirect costs and interest, that the United States, its employees, agents, contractors, consultants, and other authorized representatives incurred and paid with regard to the Site prior to May 19, 2001. In addition, EPA shall determine whether viable recalcitrant potentially responsible parties exist, and it will be in EPA's sole discretion to pursue these parties for past and future response costs in lieu of Settling Respondents.

Future costs are all costs, including, but not limited to, direct and indirect costs, that the United States incurs in reviewing or developing plans, reports and other items pursuant to this AOC, verifying the Work, or otherwise implementing, overseeing, or enforcing this AOC after its effective date. Future response costs shall also include all costs, including direct and indirect costs, paid by the United States in connection with the Site between May 19, 2001, and the effective date of this AOC and all interest on the Past Response Costs from May 19, 2001, to the date of payment of the Past Response Costs.

On a periodic basis, EPA shall submit to Respondents a bill for future response costs that includes a SCORPIO Report and sufficient documentation, if requested, to allow Respondents to determine that the costs are not inconsistent with the National Contingency Plan. Respondents shall, within thirty (30) days of receipt of the bill, remit a cashier's or certified check for the amount of the bill made payable to the "Hazardous Substance Superfund" to the following address:

U.S. EPA Region 4  
Superfund Accounting  
Post Office Box 100142  
Atlanta, GA 30384  
Attention: Collection Officer in Superfund

Payments shall be designated as "Response Costs-Red Panther Superfund Site" and shall reference the payor's name and address, the EPA site identification number A4S3, and the docket number of this Order.

Respondents shall simultaneously transmit a copy of the check to:

Paula V. Batchelor  
EPA - Region 4  
4WD-PSB / 11<sup>th</sup> Floor  
61 Forsyth Street, S.W.  
Atlanta, GA 30303

In the event that the payment for past response costs is required hereunder and is not made within sixty (60) days of the effective date of this Order or the payments for future response costs are not made within thirty (30) days of the Respondents' receipt of the a proper bill and associated documentation, Respondents shall pay interest on the unpaid balance. Interest is established at the rate specified in Section 107(a) of CERCLA. The interest to be paid for Respondents' failure to make timely payments on Past Response Costs shall begin to accrue on the effective date of the Order. The interest for Respondents' failure to make timely payments on Future Response costs shall begin to accrue on the date of the Respondents' receipt of the bill. Interest shall accrue at the rate specified through the date of the payment. Payments of interest made under this paragraph shall be in addition to such other remedies or sanctions available to the United States by virtue of Respondents' failure to make timely payments under this Section.

Respondents may dispute all or part of a bill for Future Response Costs submitted under this Order, if Respondents allege that EPA has made an accounting error, or if Respondents allege that a cost item is inconsistent with the NCP.

If any dispute over costs is resolved before payment is due, the amount due will be adjusted as necessary. If the dispute is not resolved before payment is due, Respondent shall pay the full amount of the uncontested costs into the Hazardous Substance Fund as specified above on or before the due date. Within the same time period, Respondents shall pay the full amount of the contested costs into an interest-bearing escrow account. Respondents shall simultaneously transmit a copy of both checks to the OSC. Respondents shall ensure that the prevailing party or parties in the dispute shall receive the amount upon which they prevailed from the escrow funds plus interest within seven (7) days after the dispute is resolved.

### VIII. DISPUTE RESOLUTION

The parties to this Order shall attempt to resolve, expeditiously and informally, any disagreements concerning this Order.

If the Respondents object to any EPA action taken pursuant to this order, including billings for future response costs, the Respondents shall notify EPA in writing of their objections within seven (7) days of receipt of motion of such action, unless the objections has been informally resolved.

EPA and Respondents shall within ten (10) days from EPA's receipt of the Respondents' written objections attempt to resolve the dispute through formal negotiations (Negotiation Period). The Negotiation Period may be extended at the sole discretion of EPA. EPA's decision regarding an extension of the Negotiation Period shall not constitute an EPA action subject to dispute resolution or a final agency action giving rise to judicial review.

Any agreement reached by the parties pursuant to this section shall be in writing, signed by both parties, and shall upon the signature by both parties be incorporated into and

become an enforceable element of this Order. If the parties are unable to reach an agreement within the Negotiation Period, an EPA management official at the Division Director level or higher will issue a written decision on the dispute to the Respondents. The decision of EPA shall be incorporated into and become an enforceable element of this Order upon Respondents' receipt of the EPA decision regarding the dispute, provided that nothing herein waives any defenses the Respondents may have in connection with such enforcement. Respondents' obligations under this order shall not be tolled by submission of any objection for dispute resolution under this section.

Following resolution of this dispute, as provided by this section, Respondents shall fulfill the requirement that was the subject of the dispute in accordance with the agreement reached or with EPA's decision, whichever occurs. No EPA decision made pursuant to this section shall constitute a final agency action giving rise to federal judicial review prior to a judicial action brought by the United States to enforce the decision.

#### **IX. FORCE MAJEURE**

Respondents agree to perform all requirements under this Order within the time limits established under this Order, unless the performance is delayed by a force majeure. For purposes of this Order, a force majeure is defined as any event arising from causes beyond the control of Respondents or of any entity controlled by Respondents including, but not limited to, their contractors and subcontractors, that delays or prevents performance of any obligation under this Order despite Respondents' best efforts to fulfill the obligation. Force majeure does not include financial inability to complete the work or increased cost of performance.

Respondents shall notify EPA orally within twelve (12) hours after their knowledge of event, and in writing within three (3) days, after Respondents become or should have become aware of an event which constitute a force majeure. Such notice shall: identify the event causing the delay or anticipated delay; estimate the anticipated length of delay, including necessary demobilization and re-mobilization, state the measures taken or to be taken to minimize delay; and estimate the timetable for implementation of the measures. Respondents shall take all reasonable measures to avoid and minimize the delay. Failure to comply with the notice provision of this section shall waive any claim of force majeure by the Respondents.

If EPA determines a delay in performance of a requirement under this Order is or was attributable to a force majeure, the time period for performance of that requirement shall be extended as deemed necessary by EPA. Such an extension shall not alter Respondents' obligation to perform or complete other tasks required by the Order which are not directly affected by the force majeure.

#### X. STIPULATED AND STATUTORY PENALTIES

For each day, or portion thereof, that Respondents fail to perform, fully, any requirement of this order in accordance with the schedule established pursuant to this order, Respondents, from the date of notification from the EPA, shall be liable as follows:

<u>Period of Failure to Comply</u>	<u>Penalty Per Violation Per Day</u>
1 <sup>st</sup> through 14 <sup>th</sup> day	\$ 500.00
15 <sup>th</sup> through 44 <sup>th</sup> day	\$1000.00
45 <sup>th</sup> day and beyond	\$2000.00

Upon receipt of written demand by EPA, Respondents shall make payment to EPA within seven (7) days. Interest shall accrue on late payments as of the date the payment is due which is the date of the violation or act of non-compliance triggering the stipulated penalties.

Even if violations are simultaneous, separate penalties shall accrue for separate violations of this Order. Penalties accrue and are assessed per violation per day. Penalties shall accrue regardless of whether EPA has notified Respondents of a violation or act of noncompliance. The payment of penalties shall not alter in any way Respondents' obligations to complete the performance of the work required under this Order.

Violation of any provision of this Order may subject Respondents to civil penalties up to twenty-seven thousand five hundred dollars (\$27,500) per violation per day, as provided in Section 106(b)(1) of CERCLA, 42 U.S.C. § 9606(b)(1). Respondents may also be subject to punitive damages in an amount up to three times the amount of any cost incurred by the United States as a result of such violation, as provided in Section 107(c)(3) of CERCLA, 42 U.S.C. § 9607(c)(3). Should Respondents violate this Order or any portion hereof, EPA may carry out the required actions unilaterally, pursuant to Section 104 of CERCLA, 42 U.S.C. § 9604, and/or may seek judicial enforcement of this Order pursuant to Section 106 of CERCLA, 42 U.S.C. § 9606.

#### XI. RESERVATION OF RIGHTS

Except as specifically provided in this Order, nothing herein shall limit the power and authority of EPA or the United States to take, direct, or order all actions necessary to protect public health, welfare, or the environment or to prevent, abate, or minimize an actual or threatened release of hazardous substances, pollutants or contaminants, or hazardous or solid waste on, at, or from the Site. Further, nothing herein shall prevent EPA from seeking legal or equitable relief to enforce the terms of this Order, from taking other legal or equitable action as it deems appropriate and necessary, or from requiring the Respondents in the future to perform additional activities pursuant to CERCLA or any other applicable law. EPA reserves the right to bring an action against Respondents under Section 107 of CERCLA, 41 U.S.C. § 9607, for recovery of any response costs

incurred by the United States related to this Order or the Site and not reimbursed by Respondents.

## XII. OTHER CLAIMS

By issuance of this Order, the United States and EPA assume no liability for injuries or damages to persons or property resulting from any acts or omissions or Respondents. Neither the United States nor EPA shall be deemed a party to any contract entered into by the Respondents or their directors, officers, employees, agents, successors, representatives, assigns, contractors, or consultants in carrying out actions pursuant to this Order.

Except as expressly provided in Section XIII (Covenant Not To Sue), nothing in this Order constitutes a satisfaction of or release from any claim or cause of action against the Respondents or any person not a party to this Order, for any liability such person may have under CERCLA, other statutes, or the common law, including, but not limited to, any claims of the United States for costs, damages and interest under Section 106(a) and 107(a) of CERCLA, 42 U.S.C. §§ 9606 and 9607(a).

This Order does not constitute a preauthorization of funds under Section 111(a)(2) of CERCLA, 42 U.S.C. §§ 9611(a)(2). The Respondents waive any claim to payment under Sections 106(b), 111, and 112 of CERCLA, 42 U.S.C. §§ 9606(b), 9611, and 9612, against the United States or the Hazardous Substance Superfund arising out of any action performed under this Order.

No action or decision by EPA pursuant to this Order shall give rise to any right to judicial review except as set forth in Section 113(h) of CERCLA, 42 U.S.C. § 9613(h).

## XIII. COVENANT NOT TO SUE

Except as otherwise specifically provided in this Order, upon issuance of the EPA notice referred to in Section XIX (Notice of Completion), EPA covenants not to sue Respondents for judicial imposition of damages or civil penalties or to take administrative action against Respondents for any failure to perform removal actions agreed to in this Order except as otherwise reserved herein:

Except as otherwise specifically provided in this Order, in consideration and upon Respondents' payment of the future response costs specified in Section VII of this Order, EPA covenants not to sue or to take administrative action against Respondents under Section 107(a) of CERCLA for recovery of future response costs incurred by the United States in connection with this removal action or this Order. This covenant not to sue shall take effect upon the receipt by EPA of the payments required by Section VII (Reimbursement of Costs).

10 11 0017

These covenants not to sue are conditioned upon the complete and satisfactory performance by Respondents of their obligations under this Order. These covenants not to sue extend only to the Respondents and do not extend to any other person.

#### XIV. CONTRIBUTION PROTECTION

With regard to claims for contribution against Respondents for matters addressed in this Order, the Parties hereto agree that the Respondents are entitled to protection from contribution actions or claims to the extent provided by Section 113(f)(2) and 122(h)(4) of CERCLA, 42 U.S.C. §§ 9613(f)(2) and 9622(f)(4). Nothing in this Order precludes the United States or the Respondents from asserting any claims, causes of action or demands against any person or persons not parties to this Order for indemnification, contribution, or cost recovery.

#### XV. INDEMNIFICATION

Respondents agree to indemnify, save and hold harmless the United States, its officials, agents, contractors, subcontractors, employees and representatives from any and all claims or causes of action: A) arising from, or on account of, acts or omissions of Respondents, Respondent's officers, heirs, directors, employees, agents, contractors, subcontractors, receivers, trustees, successors or assigns, in carrying out actions pursuant to this Order; and (B) for damages or reimbursement arising from or on account of any contract, agreement, or arrangement between (any one or more of) Respondents, and any persons for performance of work on or relating to the Site, including claims on account of construction delays. In addition, Respondents agree to pay the United States all costs incurred by the United States, including litigation costs arising from or on account of claims made against the United States based on any of the acts or omissions referred to in the preceding paragraph.

#### XVI. INSURANCE

At least seven (7) days prior to commencing any on-Site work under this Order, Respondents will demonstrate by evidence satisfactory to EPA that the Respondents' contractor or subcontractor shall secure and maintain for the duration of this Order, comprehensive general liability insurance and automobile insurance with limits of one million dollars, combined single limit. Respondents shall provide EPA with certificates of such insurance and a copy of each insurance policy.

#### XVII.. MODIFICATIONS

Modifications to any plan or schedule required to attain compliance with this Order may be made in writing by the OSC or at the OSC's oral direction. If the OSC makes an oral modification, it will be memorialized in writing within ten (10) days; provided, however, that the effective date of the modification shall be the date of the OSC's oral direction.

10 11 0018

Any other requirements of the order may be modified in writing by mutual agreement of the parties.

If Respondents seek permission to deviate from any approved Work Plan or schedule, Respondents' Project Coordinator shall submit a written request to EPA for approval outlining the proposed Work Plan modification and its basis.

No informal advice, guidance, suggestion, or comment by EPA regarding reports, plans, specifications, schedules, or any other writing submitted by Respondents shall relieve Respondents of their obligation to obtain such formal approval as may be required by this Order, and to comply with all requirements of this Order unless it is formally modified.

#### XVIII. NOTICE OF COMPLETION

When EPA determines, after EPA's review of the Final Report, that all removal actions required by this Order or any amendment to this Order have been fully performed in accordance with this Order, with the exception of any continuing obligations required by this Order, EPA will provide notice to the Respondents and this Order will be terminated. If EPA determines that any removal actions have not been completed in accordance with this Order, EPA will notify Respondents, provide a list of the deficiencies, and require that Respondents modify the Work Plan if appropriate in order to correct such deficiencies. Respondents shall implement the modified and approved Work Plan and shall submit a modified Final Report in accordance with the EPA notice. Failure by Respondents to implement the approved modified Work Plan shall be a violation of this Order.

#### XIX. PUBLIC COMMENT

Final acceptance by EPA of Section VII (Reimbursement of Costs) of this Order shall be subject to Section 122(I) of CERCLA, 42 U.S.C. § 9622(i), which requires EPA to publish notice of the proposed settlement in the Federal Register, to provide persons who are not parties to the proposed settlement an opportunity to comment, solely, on the cost recovery component of the settlement, and to consider comments filed in determining whether to consent to the proposed settlement. After consideration of any comments submitted during the thirty (30) day public comment period held pursuant to Section 122(i) of CERCLA, EPA may withhold consent to all or part of Section VII of this Order if comments received disclose facts or considerations which indicate that Section VII of this Order is inappropriate, improper, or inadequate. Otherwise, Section VII shall become effective when EPA issues notice to Respondents.

#### XX. SEVERABILITY

If a court issues an order that invalidates any provision of this Order or finds that Respondents have sufficient cause not to comply with one or more provisions of this

10 11 0019

order, Respondents shall remain bound to comply with all provisions of this Order not invalidated or determined to be subject to a sufficient cause defense by the court's order.

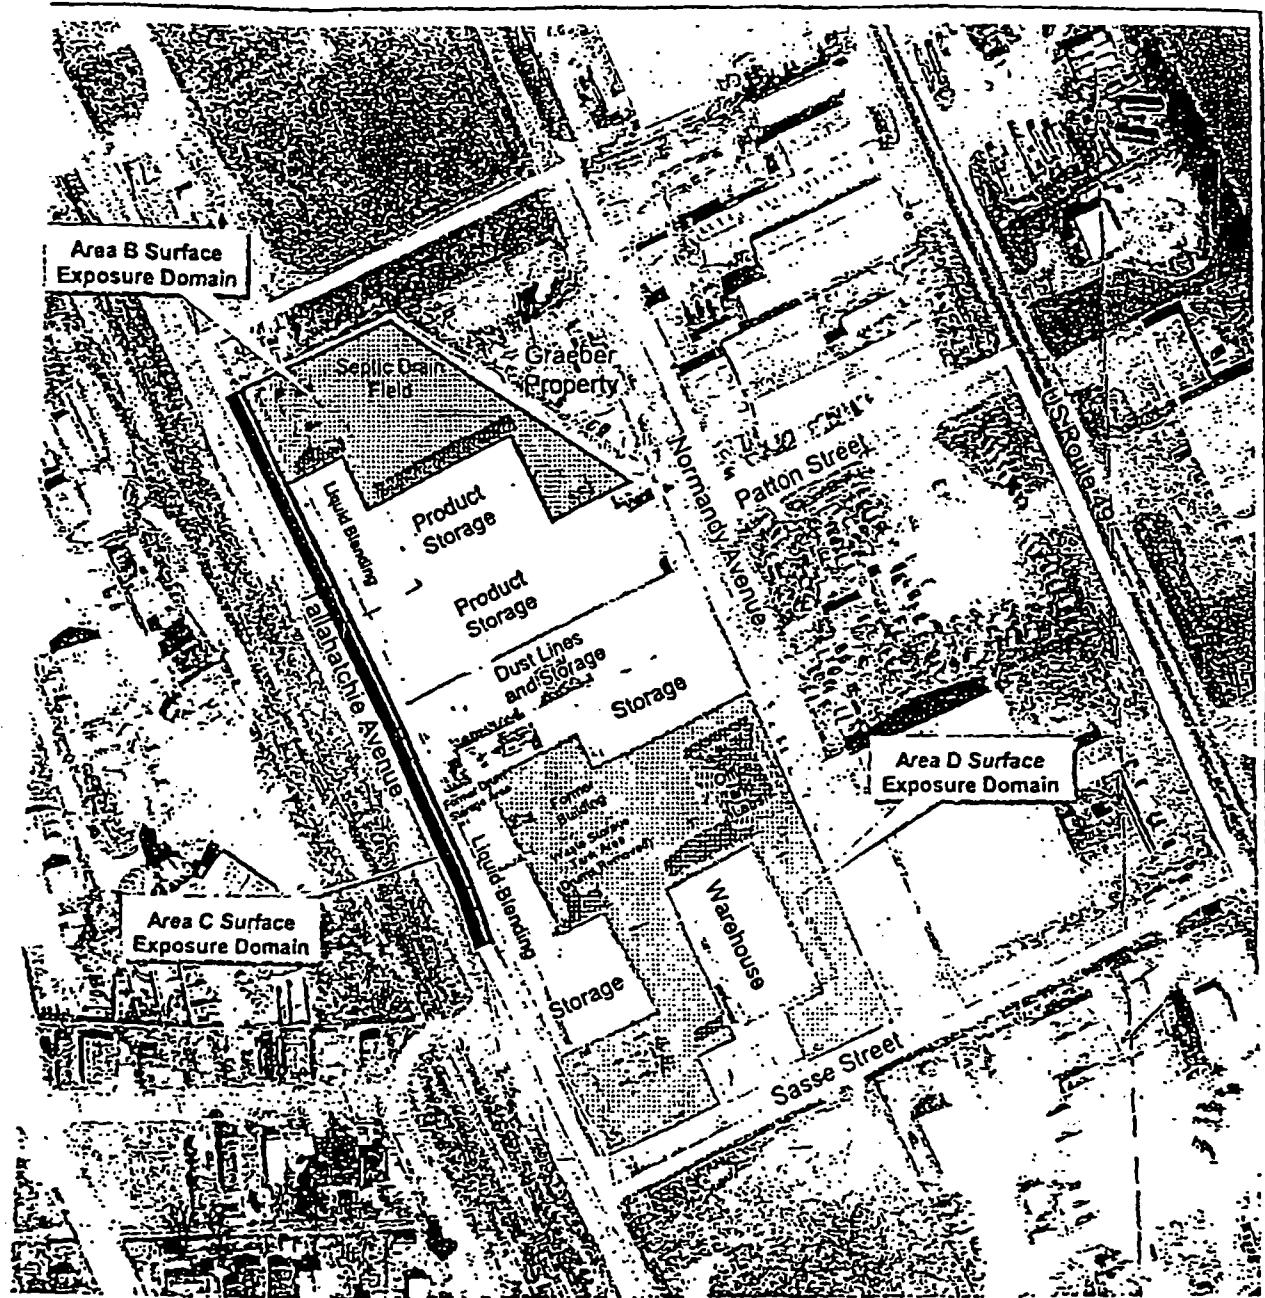

**XXL EFFECTIVE DATE**

This Order for the Red Panther Superfund Site shall be effective three business (3) days after the Order is signed by the Chief or EPA, Region 4, Emergency Response and Removal Branch.

ACTION MEMORANDUM

10095297

DATE:

SUBJECT: Request for an Enforcement Removal Action at the Red Panther Site,  
 Clarksdale, Mississippi

FROM: De'Lyntoneus Moore, OSC *[Signature]*

TO: Richard D. Green, Director  
 Waste Management Division

Site ID# MSD000272385

**I. PURPOSE**

The purpose of this Action Memorandum is to request and document approval of the proposed removal action described herein for the Red Panther Site in Clarksdale, Coahoma County, Mississippi. The site has extensive, shallow soil contamination by a number of chlorinated pesticides and other hazardous substances. This removal action is necessary in order to abate the continued release and/or substantial threat of release of these hazardous substances, which pose a significant threat to the public health and the environment. This removal action will be conducted by potentially responsible parties (PRPs) pursuant to an Administrative Order on Consent (AOC).

**II. SITE CONDITIONS AND BACKGROUND**

The Red Panther Site (RPC) is located in Clarksdale, Mississippi and was owned and operated by the Red Panther Chemical Company. Liquid and dry herbicides, insecticides, and fungicides were formulated at the facility between 1949 and 1978. Before ownership by the RPC, the facility was owned by the Coahoma Chemical Company, Riverside Chemical Company, and MFC Services. During this site investigation, it was confirmed that the property is highly contaminated with a wide variety of organo-chlorinated pesticides and arsenic. Toxaphene contaminant levels are up to 120,000 mg/kg, DDT (1,400 mg/kg), arsenic (443 mg/kg), chlordane (270 mg/kg), dieldrin (200 mg/kg). The conditions at the Site meet the requirements of

an imminent and substantial endangerment to the public or environment, as stipulated in 40 CFR § 300.415 of the National Contingency Plan (NCP). A removal action is deemed necessary by the OSC to abate the threats present and eliminate the sources of confirmed and/or potential contaminant migration.<sup>1</sup>

#### A. Site Description

##### 1. Removal site evaluation

On June 14, 1999, a site investigation was performed by the Superfund Technical Assessment and Response Team (START) under the direction of EPA Region 4 Emergency Response and Removal Branch (ERRB). Raw material was received by the facility on a railroad spur located behind the process buildings. Analytical results revealed toxaphene levels up to 10,000 mg/kg were detected in the soils within this area. DDT was detected at 900 mg/kg and arsenic, up to 152 mg/kg.

Chemicals used in the formulation of insecticides at RPC included: toxaphene, methyl parathion, chloropyrifos, 2, 4 D, malathion, arsenic, carbaryl, diazinon, methoxychlor, DDT, disodium methanearsonate (DSMA), monosodium acid methanearsonate (MSMA), chlorothalonil, and parathion. During its operational period, RPC routinely released contaminated wastewater from the formulating process to the ditches along Normandy Avenue and Patton Street. Sampling data confirms elevated levels of hazardous substances in these areas. Contaminated particulate matter has migrated off the facility via surface water and air-borne pathways. Occupants of the nearby facilities and area residents are subject to exposure from this migration via direct contact, inhalation, and/ or ingestion.

##### 2. Physical location

The Site is located in Clarksdale, Mississippi and is owned and operated by Red Panther. The facility's geographic coordinates are N34° 41' 20" latitude and W90° 33' 45" longitude. Normandy Avenue borders the eastern side of the RPC facility, Sasse Street borders the southern side, and Tallahatchee Avenue and the Illinois Central railroad track borders the western side. Property adjacent to the northern boundary of the Site is unoccupied. Businesses in the vicinity of the RPC facility include farm equipment and supply stores, a painting and sandblasting operation, and a used car sales lot. A grain storage and concrete plant lie adjacent to Sasse Street to the south. A residential area lies less than a 1/4 mile south of the facility. The facility occupies approximately 6.6 acres.

---

1 Letter Report submitted to De'Lyntoneus Moore, OSC  
September 2, 1999  
Tera Tech EM, Inc.  
Red Panther Chemical Company  
EPA Contract No. 68-W5-0021  
TTD No. 04-9905-0024

The topography is relatively flat, with an average elevation at 175 feet above mean sea level (msl). The RPC facility lies at 170 feet msl. Drainage pipes direct site runoff east and west into off-site ditches and storm water drains, which lead to the Sunflower River.

### 3. Site characteristics

RPC is currently used as a storage facility for seeds and farm chemicals. This activity is not suspected to be contributing to the site contamination. Contamination found on-site is believed to have originated from numerous spills during loading and unloading operations, from leaking transport piping between the process and tank farm areas, contaminated wastewater releases, and from spills and leaking underground piping in the tank farm area. No previous removal activity has ever been conducted at this site.

### 4. Release or threatened release into the environment of a hazardous substance, or pollutant or contaminant

A number of conditions make RPC an immediate risk to public health, welfare and the environment. These include the character and volume of hazardous substances present at the site, site location relative to potential receptors, and physical factors such as hydrology, pedology, and topography.

The soil contamination at the Site currently poses a threat to public health and welfare. Loose soil containing elevated levels of chlorinated pesticide and metals may migrate off-site through air and surface water exposure pathways. Any occupants of the site and the surrounding areas can be subject to exposure via direct contact. The past, present or potential migration of hazardous substances from the Site constitutes an actual or threatened release, as defined in Section 101(22) of CERCLA, 42 U.S.C. 9601(22).

The host of hazardous substances present at RPC includes several organic pesticides that are known to be extremely toxic to terrestrial and especially aquatic life. Many of the substances are suspected human carcinogens and known animal carcinogens. The contaminated soil at the Site poses a threat to public health and welfare. Substances detected on the site, including toxaphene, DDT, DDE, DDD, arsenic, benzene hexachloride, chlordane, disulfoton, methyl parathion, and aldrin. All are hazardous substances as defined in Section 101(14) of CERCLA, as amended, 42 U.S.C. 9601(14).

### 5. NPL status

This site is not listed on the National Priorities List and is not expected to score high enough for inclusion.

**6. Maps, pictures, and other graphical representations**

None

**B. Other Actions to Date****1. Previous actions**

On June 14, 1999, a site investigation was performed by the Superfund Technical Assessment and Response Team (START) under the direction of EPA Region 4 Emergency Response and Removal Branch (ERRB). During this site investigation, it was confirmed that the property was highly contaminated with a wide variety of organo-chlorine pesticides and arsenic. The conditions at the Site meet the requirements of an imminent and substantial endangerment to the public or environment, as stipulated in 40 CFR § 300.415 of the National Contingency Plan (NCP).

The OSC determined that conditions at the Site represented an imminent and substantial threat to public health or environment. The owner/operator was subsequently contacted to initiate a PRP lead removal action. The owner/operator was unable to conduct the removal activity due to financial constraints. During the course of this site evaluation, EPA Region 4 personnel were able to determine additional, viable PRPs that could undertake the necessary removal activity. Negotiations were initiated immediately to draft an acceptable AOC. The Enforcement Addendum is attached as a reference.

**2. Current actions**

None

**C. State and Local Authorities' Role****1. State and local actions to date**

Officials from the Mississippi Bureau of Pollution Control (MDEQ) conducted a site inspection in 1991. In a January 1992 letter, MDEQ made a recommendation of no further remedial action. Since that time MDEQ has not taken any response actions to mitigate the threats posed by the Site.

**2. Potential for continued State/local response**

It is unlikely that any State or other political subdivision will undertake any response activity on this site in the future due to the lack of available funding.

### III. THREATS TO PUBLIC HEALTH OR WELFARE OR THE ENVIRONMENT, AND STATUTORY AND REGULATORY AUTHORITIES

#### A. Threats to Public Health or Welfare

The National Contingency Plan provides the following criteria for use as a reference in the determination of the need for a removal action.

*Section 300.415 (b)(2)(iv): "High levels of hazardous substances or pollutants or contaminants in soils largely at the surface, that may migrate."*

Due to the general dusty conditions and sparse vegetation at the Site, the contaminated soil can be easily displaced and migrate off-site. Soil on the property is highly contaminated with a wide variety of organo-chlorinated pesticides and arsenic. Human exposure to these compounds can be accomplished via the migration of contaminated dust and particulate matter. During its operational period, RPC, released contaminated wastewater from the formulating process to the ditches along Normandy Avenue and Patton Street. These areas displayed elevated contaminant levels commensurate with that practice. Toxaphene levels were up to 120,000 mg/kg, DDT (1,400 mg/kg), arsenic (443 mg/kg), chlordane (270 mg/kg), dieldrin (200 mg/kg). These hazardous substances are readily available for further migration along the surface water drainage pathways. The June 1999 Site Assessment confirmed the presence of elevated pesticide contamination along the Patton Street corridor. This parking area is adjacent to a runoff collection area and has displayed elevated chlorinated pesticide and arsenic levels.

Unless the source of contamination at RPC is removed, releases to the environment will continue via windblown contamination, contaminated surface runoff, and vertical migration to the groundwater. The majority of hazardous substances at RPC are persistent in the environment. Since many of the contaminants are known to strongly bioaccumulate, extremely small concentrations of these materials in soil, surface water, and groundwater may have a serious adverse impact on the environment. Pesticides that bioaccumulate (such as DDT) may migrate up through the food chain.

*Section 300.415 (b)(2)(i): "Actual or potential exposure to nearby human populations, animals, or the food chain from hazardous substances or pollutants or contaminants."*

The site continues to present an imminent and substantial endangerment to the public. The proximity of RPC to human receptors of all age groups and the pervasive contamination that remains there, represents a potential of exposure to concentrations of pesticides in the thousands of parts per million at the site. Many of the pesticides that are present at the site are suspected human carcinogens. Even minute concentrations of these substances may increase the cancer risk of exposed individuals. Some of the hazardous substances at RPC are strongly bioaccumulated. Thus,

in addition to other routes of exposure, humans may also be exposed to hazardous substances through ingestion of contaminated fish and wildlife. Workers of the surrounding facilities routinely congregate in the Normandy and Patton corridor before during and after work. Lunch and work breaks in the area may facilitate the ingestion of contaminated soil particles as the dust in these areas are disturbed by industrial, vehicular and pedestrian traffic.

For example, for human exposure, a cancer risk of 1 in 1,000,000 is posed by chronic exposure to a concentration of 0.44 mg/kg (ppm) of toxaphene in soil. In comparison, toxaphene concentrations up to 120,000 mg/kg (ppm) in surficial soils have been documented at RPC. The proximity of this highly contaminated site to human receptors of all age groups constitutes an immediate threat to public health and welfare. The site lies within ½ mile of a school and within 1/4 mile of a residential area.

The health and environmental effects of the major contaminants for the site are summarized below. The human health-based criteria given are based on 1 in 1,000,000 ( $10^{-6}$ ) for carcinogens and 1 in 100,000 risk for Class C carcinogens.<sup>2,3</sup>

**Aldrin/Dieldrin:** Aldrin was detected in soil samples in concentrations up to 160 mg/kg. Dieldrin was detected in soil samples in concentrations up to 200 mg/kg. Aldrin degrades to dieldrin, which is very persistent in the environment, and both pesticides have been determined to pose a substantial risk of cancer to humans. A concentration 0.029 mg/kg soil is believed to pose a human cancer risk of 1 in 1,000,000 for chronic exposure. The OSHA permissible exposure limit (PEL) for the workplace has been established at 0.25 mg/m<sup>3</sup>. Both chemicals are very toxic to aquatic organisms and have been connected with large-scale kills of terrestrial wildlife in treated areas.

**Chlordane:** Chlordane was detected in soil samples in concentrations up to 490 mg/kg. Chlordane is a broad spectrum insecticide. The poison attacks the central nervous system, eyes, lungs, liver, kidneys, and skin. Harmful effects and symptoms of exposure include blurred vision, nausea, vomiting, and convulsions. For humans, a 1 in 1,000,000 cancer risk is presented by chronic exposure to 1.6 mg/kg of chlordane in soil. The PEL for chlordane in the workplace atmosphere has been set at 0.5 mg/m<sup>3</sup>.

**DDT:** DDT and its degradation products were detected in soil samples in concentrations up to

<sup>2</sup> Region 9 Risk-based Preliminary Remediation Goals (PRGs)

Centers for Disease Control and Prevention  
National Institute for Occupational Safety and Health

1,400 mg/kg. DDT is a broad spectrum insecticide that was banned for use in 1972 by the EPA. DDT and its metabolites are persistent in soil and water and easily dispersed by erosion and runoff. DDT is strongly bioaccumulated in humans and wildlife. DDT and its metabolites are highly toxic to aquatic organisms. In addition, DDT has been linked with the decreased reproductive success of many bird species. Most concern about the toxicity of DDT is related to its chronic effects due to its strong tendency to bioaccumulate. Chronic exposure to DDT can damage the central nervous system and liver. In addition, DDT is a reproductive toxin. For humans, a 1 in 1,000,000 additional cancer risk is believed to result from chronic exposure to 1.7 mg/kg of DDT in soil. The PEL for the workplace is 1 mg/m<sup>3</sup>.

**Toxaphene:** Toxaphene contaminated soils are present on-Site in concentrations up to 10,000 mg/kg. Toxaphene is a chlorinated organic pesticide that is persistent in the natural environment. Toxaphene is an animal carcinogen and is highly toxic to aquatic organisms. In humans, symptoms of toxaphene exposure include vomiting, convulsions, cyanosis, and coma. For human exposure, an additional lifetime cancer risk of 1 in 1,000,000 is presented by a concentration of 0.44 mg/kg of toxaphene in soil. The MCL for toxaphene is 5 ug/l. A PEL for toxaphene in the workplace is 0.5 mg/m<sup>3</sup>.

**Arsenic:** Arsenic was detected in soil samples in concentrations up to 843 mg/kg. Arsenic is a known poison and carcinogen that has been shown to cause skin and lung cancer. It may also damage a developing fetus and should be handled as a potential teratogenic compound. Oral exposures can cause skin abnormalities, digestive tract pain, nausea, abnormal heart functions, liver and kidney damage. For humans, a 1 in 1,000,000 additional cancer risk is believed to result from chronic exposure to 0.39 mg/kg of arsenic in soil. A PEL of 0.010 mg/m<sup>3</sup> has been established for the workplace environment. In drinking water, a maximum level of 0.05 mg/l has been established.

## B. Threats to the Environment

**Section 300.415 (b)(2)(ii) "Actual or potential contamination of drinking water supplies or sensitive ecosystems."**

The hazardous substances found at the RPC site are extremely toxic to aquatic life. The impact of RPC on nearby aquatic communities is evidenced by a November 1985, fish kill in the Sunflower River from on site runoff.<sup>5</sup> If the potential source of the groundwater contamination is

January 31, 1991

not removed, vertical migration may possibly affect area drinking water sources. At this time, no residential drinking water sources (municipal or private) have been contaminated with substances associated with this site.

*Section 300.415(b)(2)(vii) "Availability of other appropriate federal or state response mechanisms to respond to the release."*

It is not expected that any State or Local entity will initiate and maintain any removal activity at this site. To this date, neither the State of Mississippi nor the local government has identified the resources necessary to conduct the removal activities required to mitigate the threats present at the Site. Viable PRPs have been identified to conduct the removal activities necessary to mitigate the hazards present at this site.

#### **IV. ENDANGERMENT DETERMINATION**

Actual or threatened releases of the hazardous substances from this site, if not addressed by implementing the removal action selected in this Action Memorandum, may present an imminent and substantial endangerment to the public health or welfare or the environment.

#### **V. PROPOSED ACTIONS AND ESTIMATED COSTS**

##### **A. Proposed Actions**

###### **1. Proposed action description**

Based upon a review by the Region 4 Office of Technical Services, a site specific cleanup goal of for each substance listed below was developed for the PRPs. The clean-up goals are less than or equal to the following concentrations: Arsenic – 23 ppm; Toxaphene –39 ppm; Dieldrin- 3 ppm; Total Chlorinated pesticides- 100 ppm.<sup>6</sup>

EPA Region IV proposed removal activity at the site can be summarized as follows:

- Determine the volume of contaminated soil through extensive soil sampling.
- Excavate all contaminated soils specifically containing above 39 mg/kg Toxaphene, 40 mg/kg Arsenic, and 3.0 mg/kg Dieldrin as identified within the scope of the removal evaluation. Excavate all other contaminated soil to 100 mg/kg total chlorinated pesticides as identified within the scope of the removal evaluation.

---

<sup>6</sup> Memorandum to De'Lyntoneus Moore  
June 28, 2000  
"Review of Soil Data Summary and Proposed Remedial goals  
Red Panther Pesticide Site, Mississippi"  
Submitted by H. Glen Adams, Risk Assessment Specialist  
Office of Technical Services

- Treat, store, and/or dispose of all site related hazardous waste at a RCRA-approved disposal facility.
- Conduct post-excavation sampling in the excavated areas to assure that clean-up levels have been achieved.
- Provide for the collection and treatment/disposal of all contaminated waters, rinses, and sediment accumulated as a result of the decontamination operation.
- Secure the area of concern in such a manner as to prevent the access of unauthorized pedestrian traffic.

## 2. Contribution to remedial performance

The proposed removal activity is designed to eliminate the threats of exposure and release at the Site and will provide the abatement necessary to protect public health, welfare, and the environment. The site is not expected to obtain a score sufficiently high enough to warrant inclusion on the NPL. Therefore, no subsequent remedial activity is likely to take place at the Site. If the Site were to undergo a remedial action, then the planned removal activity would contribute to the long term remedial performance of the site.

## 3. Description of alternative technologies

Because the final disposition of the waste materials at the site has not been determined, no formal evaluation of alternative technologies has been made. Such an evaluation will take place before the disposal phase of the response action and will be documented at that time.

## 4. EE/CA

Not applicable, Time-critical removal action

## 5. Applicable or relevant and appropriate requirements (ARARs)

Potential Federal ARAR(s) for RPC are the Resource Conservation and Recovery Act (RCRA) and the Off Site Rule (CERCLA § 121(d)(3)). To date, the State of Mississippi has not identified any ARARs.

At this time the State of Mississippi has not identified any substantively additional ARARs.

## 6. Project Schedule

Response actions at the site will be initiated upon approval of this Action Memorandum. Foregoing any unexpected delays, all actions are expected to be completed within one year of mobilization.

### A. Estimated Costs

No cost estimate is necessary because this is an enforcement- lead removal action.

## VI. EXPECTED CHANGE IN THE SITUATION SHOULD ACTION BE DELAYED OR NOT TAKEN

If action is significantly delayed or not taken there will be continued releases into the environment increasing the possibility of exposure to the public. If no actions are taken, the site will remain a threat to public health and the environment. All exposure routes that threaten residents of the area remain at RPC. Unless source control is performed, groundwater may be affected. Also, surface streams and aquatic ecosystems will continue to be impacted by contamination from sources such as storm water runoff, sediment input, and groundwater.

## VII. OUTSTANDING POLICY ISSUES

None

## VIII. ENFORCEMENT

Enforcement activities are ongoing. EPA is negotiating an AOC with a group of PRPs. The enforcement strategy for the Site has been developed through consultation with the Environmental Accountability Division, Office of Legal Support. See the attached Enforcement Addendum for additional information.

2 9 0011

## IX. RECOMMENDATION

This decision document represents the selected removal action for the Red Panther Chemical Company Site in Clarksdale, Mississippi; developed in accordance with CERCLA as amended, and consistent with the NCP. This document is based on the administrative record for the site.

Conditions at the site meet the NCP section 300.415(b)(2) criteria for a removal and I recommend your approval of the proposed removal action..

## 1.0 INTRODUCTION

The Mississippi Department of Environmental Quality, Office of Pollution Control, has conducted a screening site inspection (SSI) at the Red Panther facility in Clarksdale, Coahoma County, Mississippi. The inspection was performed under the authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA). The field investigation was conducted on November 12 and 13, 1990.

### 1.1 Objectives

The objectives of the SSI were to determine the nature of contaminants present at the site and to determine if a release of these substances has occurred or may occur. Further, the SSI inspection sought to determine the possible pathways by which contamination could migrate from the site, and the populations and environments that could be potentially affected. Through these objectives, a recommendation was made regarding future CERCLA action at the site.

### 1.2 Scope of Work

The objectives were achieved through the completion of a number of specific tasks, as follows:

- Review background materials and topographic maps relevant to HRS scoring of the site;
- Evaluate target populations associated with the groundwater, surface water, air, and on-site exposure pathways;
- Verify the location and distance to the nearest drinking water well and irrigation well;
- Develop a site sketch and take photographs;
- Collect environmental samples.

190014

## 2.0 SITE CHARACTERIZATION

### 2.1 Site Location and Contact Official (References 1 & 2)

Red Panther Chemical Company is located south of the intersection of Highway 61 and Highway 49, in Clarksdale, MS.

County Code	027
Congressional District:	01
Coordinates:	Latitude: 34° 41' 20" Longitude: 90° 33' 45"
Location:	SW1/4 NW1/4 NE1/4 S25 -T27N -R4W
Directions to Site:	Red Panther Chemical Company is reached by traveling south on Hwy 49 from the intersection of Hwy 61 and Hwy 49. Travel about 1/2 mile and turn right on Patton Street. Go to the end of Patton Street and turn left onto Leflore Avenue. Red Panther is on the west side of Leflore Avenue.
Contact Officials:	Jim Thomas Red Panther Chemical Company P. O. Box 550 Clarksdale, Mississippi 38614 601-627-4731
	John Duff, President Red Panther Chemical Company P. O. Box 550 Clarksdale, Mississippi 38614 601-627-4731

### 2.2 Site Background and History (References 1 and 2)

Red Panther Chemical Company is a pesticide formulating plant. The facility has been engaged in the formulation of liquid and powdered herbicides, insecticides, and fungicides since 1949. Former owners are Coahoma Chemical Company (the original owner), Riverside Chemical Company, and MFC Services.

In 1980, Red Panther filed a RCRA notification for storage of wastewater in tanks and dirty solvents in drums. These wastes are generated from cleaning the process equipment. The wastewater contains pesticide and solvent residues. The dirty solvents contain pesticide residues. The dirty solvents are generally reused in the formulating process.

19 0015

In November of 1984, Red Panther obtained a RCRA Part B permit from the MS Bureau of Pollution Control (BPC) for storage of the above mentioned wastes.

In November of 1986, Red Panther's storage permit was terminated because Red Panther lost its liability insurance coverage that is required for long-term storage of hazardous wastes. At that time, Red Panther reverted to the status of a hazardous waste generator with short-term (less than ninety day) storage only.

In November of 1985, there was a fire at one of the Red Panther warehouses. Contaminated runoff resulting from the fire-fighting effort caused a fish kill in the nearby Sunflower River. The contaminant was Lorox, a slightly toxic herbicide. A large volume of the contaminated water was contained on site and later shipped to a commercial hazardous waste disposal facility.

During the investigation and cleanup after the fire, 382 old fiber drums were discovered in the crawlspace below the warehouse that burned. Two hundred and eighty-seven of the drums were empty. These drums were crushed and sent to the local municipal landfill. Ninety-five of the drums contained trace residues of technical grade dieldrin and were disposed of at a commercial hazardous waste facility. A new warehouse was built over this area in 1986.

At various times in the past, wastewater from the formulating process has apparently been discharged either directly to a ditch off-site along Leflore Avenue and Patton Street, or into an underground septic tank and drainfield on-site. Red Panther was issued a "no discharge" permit in 1984 by the BPC.

Red Panther is currently classified as a hazardous waste generator.

### 2.3 Site Description (References 1, 2, & 5)

Red Panther Chemical Company is located off of Highway 49 South in Clarksdale, MS. The surrounding land use is mainly commercial. The facility is surrounded by a fence and is not accessible to non-employees. It is bordered on the west by East Tallahatchie Avenue, and also by a spur track that connects with the Illinois Central railroad track located just west of the avenue. West of the main track is a residential area. A school, Washington School, is located about 2,000 feet west of the facility. The property north, east, and south of the facility is commercial. Leflore Avenue borders the facility on the east.

The facility is about six and one-half acres in size. Buildings on the property include formulating plants, warehouses, a maintenance building, boiler room, and the main office. There are also two tank farms on site. Various raw materials and products are stored in the tanks. One tank in the south tank farm is used for storage of wastewater. There is also a wastewater collection pit at this location. An abandoned, underground septic drain/drainfield is located in the north tank farm area.

19 0016

In the past, contaminated wastewater has been discharged to an off-site drainage ditch along Leflore Avenue and also to the underground septic drain/drainfield with little or no containment. The depth of contaminated soil is unknown, so a depth of six feet is assumed.

#### 2.4 Waste Quantity/Containment

The total quantity of hazardous substances deposited at the site is not known. However, based on elevated levels of toxaphene, DDT, and several other compounds that were detected in soil/sediment samples collected during the SSI, releases have occurred, probably as a result of spills and inadequate containment practices in the past. Therefore, a minimum waste quantity of ten cubic yards can be assumed. Toxaphene has a severe toxicity rating and is highly persistent (Reference 4).

Red Panther generates wastewater and spent solvents from the formulating process. The total annual quantity of hazardous waste reported in the Red Panther 1980 RCRA hazardous waste notification was approximately 6318 kilograms. The facility has been operating for about forty years (Reference 1).

### 3.0 GEOLOGY AND HYDROLOGY

#### 3.1 Stratigraphic Units (References 1)

The stratigraphic units in this part of the state in descending order are as follows:

Mississippi River Valley Alluvium, Cook Mountain, Sparta, Zilpha, Winona, Tallahatta, Meridian-Upper Wilcox, Lower Wilcox.

The Mississippi River Valley Alluvial Aquifer is one of the most prolific and widespread aquifers in northwestern Mississippi. It is primarily a water table aquifer. The formation dips gently to the south and is exposed at the surface over its entire area of occurrence. Alluvial deposits blanket and underlie the entire Mississippi Delta.

The upper surface of the Alluvial Aquifer is at land surface and the base of the alluvium averages about 140 feet lower. A layer of clay at land surface confines or semiconfines the water in most of the aquifer when the water is near land surface. Geophysical logs of wells in vicinity of the facility indicate that the Alluvial Aquifer extends to a depth of about 125 feet below the land surface in this area. The lower part of the Alluvial Aquifer consists of coarse sand and gravel which grades upward through coarse sand, fine sand, silt, and clay. Results from aquifer tests indicate hydraulic conductivities of 170 to 190 ft/day or  $6.7 \times 10^{-2}$  cm/sec.

The Cook Mountain is composed of clay and shale with an estimated permeability of  $10^{-5}$  cm/sec. In some areas of northwestern Mississippi, the Cook Mountain confines the underlying Sparta aquifer. However, geophysical logs of wells in vicinity of the facility suggest that the Cook Mountain pinches out in the Clarksdale area. Therefore, the Alluvial Aquifer and the Sparta are probably hydraulically connected in this area.

The Sparta is composed of rounded, well-sorted quartz grains in two or three thick beds separated by beds of clay. Regionally, water in the Sparta moves from east to west. The unit dips to the west at about 25 feet per mile. Lithologic data and geophysical logs of wells in the surrounding area indicate that the Sparta Aquifer is approximately 500 feet in thickness and occurs at a depth of approximately 155 feet below the land surface in this area. The average hydraulic conductivity of the Sparta is 67 ft/day.

The Zilpha and Winona occurs approximately 655 feet below the land surface and underlies the Sparta Aquifer. The Zilpha consists of dark-brown clay which overlies the Winona and prevents movement of water between the Winona and the Sparta. The Winona consists of glauconitic fossiliferous sands and clays.

The Tallahatta is hydraulically connected with the overlying Winona. The Tallahatta contains several thick to very thin sand beds that are separated by clay. The aquifer dips to the west and southwest. The aquifer tests on wells in the Winona-Tallahatta Aquifer indicate a hydraulic conductivity of 6.7 ft/day. The base of the Winona/Tallahatta Aquifer is approximately 1120 feet below the land surface.

The Meridian Sand of the Tallahatta, together with uppermost sand beds of the Wilcox Group, is an aquifer throughout the area. These units are regarded as one aquifer because they are hydraulically connected.

The Meridian Sand is a massive unit consisting of fine-to-coarse micaceous sand. The Upper Wilcox Aquifer consists of a less permeable sandy clay that dips west to southwest at 28 to 40 ft/mile. The configuration of the top of the Meridian-Upper Wilcox Aquifer occurs approximately 1120 feet below the land surface and is approximately 300 feet in thickness. Hydraulic conductivity of the aquifer ranges between 30 to 68 ft/day.

The Lower Wilcox is the deepest aquifer underlying the region. The Lower Wilcox consists of a thick sand unit containing over 60 percent sand. The aquifer dips about 50 ft/mile to the southwest in the southern part of the region. Multiple clay beds in the overlying part of the Wilcox hydraulically separate the Lower Wilcox Aquifer from overlying aquifers. The Lower Wilcox Aquifer occurs approximately 1900 feet below the land surface and extends to a depth of approximately 2100 feet in the site area. Hydraulic conductivity of the aquifer ranges from 29 to 64 ft/day.

### 3.2 Aquifer of Concern (References 1 and 2)

The Alluvial Aquifer and the Sparta are probably hydraulically connected in the Clarksdale area. Therefore, they are considered as one aquifer, the aquifer of concern (AOC). The estimated depth to the water table is about 30 feet below the land surface. The Alluvium is composed of silt, clay, and loam in the upper part and coarse sand and gravel in the lower part. The estimated permeability of the unsaturated zone of the Alluvium is  $10^{-4}$  cm/sec.

GH

Clarksdale  
Public (city of Cleveland) wells within a three-mile radius of the site provide drinking water to 6,500 connections or 24,700 people. Water from these wells is distributed through the same system.

The nearest drinking water well is a public well located about 1,100 feet south of Red Panther at the Lewis Wilkens Generating Station, a city-owned electric generating plant. This well is screened at about 592 feet below land surface in the Sparta. There are also nine industrial wells at this station that provide cooling water for the plant operation. These wells are screened in the Alluvial Aquifer. There are also a number of irrigation wells within the three-mile radius.

### 3.3 Precipitation (Reference 1)

Northwestern Mississippi has a humid subtropical climate influenced by the Gulf of Mexico. Mean annual precipitation is approximately 51 inches of which about one-third runs off and about one-third seeps into the ground. Evapotranspiration accounts for the remaining third. Most of the water that seeps into the ground is later released to the streams. Approximately less than 5% of the rainfall goes into storage in the aquifers. January is the wettest month and October is the driest.

The mean annual lake evaporation for the area is approximately 42 inches. The net annual precipitation of the area is about 9 inches. The one-year, twenty-four-hour rainfall is approximately 3.5 inches.

### 3.4 Surface Water (Reference 1 and 2)

The facility and surrounding area is nearly flat. Some surface runoff and/or discharge from the facility drains into the drainage ditch along Leflore Avenue and Patton Street east of the facility. This ditch drains into another ditch along Highway 49, which intersects an intermittent stream about 22,400 stream feet southeast of the facility. This intermittent stream flows in a westerly direction for about 4,000 stream feet before entering the Sunflower River. The fifteen-mile migration pathway ends in the Sunflower River.

19 0019

There is another (shorter) potential migration pathway to the Sunflower River via storm drains located on the west side of the facility along East Tallahatchie Avenue. These storm drains flow directly into the Sunflower River about 3,000 feet west of the facility, bypassing the city POTW plant.

In November 1985, contaminated runoff from a warehouse fire at the facility caused a fish kill in the Sunflower River. This contaminated water likely drained through the above mentioned storm drains into the Sunflower River.

#### 4.0 SENSITIVE ENVIRONMENTS

There are no national wildlife refuges, critical habitats of federal endangered species, or wetlands along the extended surface water migration pathway (Reference 1).

#### 5.0 FIELD INVESTIGATION

##### 5.1 Sampling History (Reference 1)

In August, 1984, a contractor performed a sampling inspection at Red Panther for the MS OPC. Environmental samples were collected around the site to determine and characterize any hazardous substances present. Two composite soil samples were taken from the off-site ditch along Leflore Street and Patton Street. One water sample was taken where wastewater leaves the property and discharges into the above mentioned ditch. One subsurface composite soil sample was collected from the underground septic tank/drain field area. All these samples were analyzed for pesticides and total arsenic.

The test results of the soil and sediment samples indicated elevated levels of toxaphene, arsenic, and several other pesticides.

##### 5.2 Sample Collection Methodology

All sample collection, preservation, and chain-of-custody procedures used during the 1990 SSI were in accordance with the standard operating procedures specified in Sections 3 and 4 of the Engineering Support Branch Standard Operating Procedures and Quality Assurance Manual, United States Environmental Protection Agency, Region IV, Environmental Services Division, April 1, 1986.

##### 5.3 Description of Samples and Sample Locations

The purpose of the field investigation was to characterize the chemical composition of sediment, subsurface soil, and surface water samples collected from potentially contaminated areas. The selection of sample locations was based on visual observations and historical information. Background soil samples were collected. Groundwater samples were also collected to determine if

site-related contaminants have impacted either the groundwater below the facility or the nearest drinking water well.

A total of nine (9) samples were collected during the SSI: four surface soil/sediment samples, two subsurface soil samples, and three groundwater samples. A trip blank was also included. Sample codes and descriptions are shown in Table A of the Appendix.

#### 5.4 Analytical Support and Methodology

All samples were analyzed for the compounds listed in the EPA Target Compounds List (TCL). Analyses were performed by Mississippi State Chemical Laboratory (MSCL), Starkville, Mississippi.

The analyses were performed in accordance with the standard procedures and protocols specified in the USEPA manual SW-846, "Test Methods for Evaluating Solid Waste," second edition, or equivalent procedures.

#### 5.5 Mississippi State Chemical Laboratory AQ/QC Procedures

Internal QC for analytes consists of the analysis of surrogate spikes, matrix spikes, matrix blanks, and internal standards with each set of environmental samples of a specific matrix type. Samples are submitted for analysis in small groups typically containing less than 12 samples of any one type, so only one of each of the above QC samples is normally analyzed with each set of samples of a specific matrix. All analytical data are subjected to a QA review to determine their acceptability. Percent recoveries are calculated from matrix spikes for each class of analytes and matrix type. Those data are accepted as valid for which recoveries of 70-130% are obtained. Reported analytical results are flagged for which applicable surrogate recoveries are outside acceptable limits, as suggested in SW-846. Data for sample sets where matrix spike recoveries are not acceptable are deemed invalid, in which case the sample set, including surrogates, blanks, and spikes, are reanalyzed. Standard deviations and coefficients of variation are calculated from recovery data for sets of matrix spikes for specific analytes accumulated over a period of months or even years, illustrating the continuous performance of a particular analytical method for a matrix-analyte pair.

#### 5.6 Analytical Results (References 2 and 3)

Analytical results are discussed below and also summarized in Tables 1-5 in the Appendix.

##### Sediment Samples

One composite sediment sample (RPC-SD-06) was collected from the drainage ditch along the east side of Leflore Avenue (Leflore Avenue borders the east side of the facility). Another composite sediment sample (RPC-SD-07) was collected where a concrete drain on Red Panther property discharges into the ditch along the west side

of Leflore Avenue. A culvert connects this drainage with the ditch on the east side of the avenue.

High levels (1,270 & 1,130 ppm) of toxaphene, and elevated levels of several other pesticides, were detected in these samples. Elevated levels of several volatile and semivolatile organic compounds were also detected in these two samples, especially in RPC-SD-06, which contained 16,000 ug/kg (ppb) of xylenes, 1,600 ug/kg of ethyl benzene, 790 ug/kg of 2-methylnaphthalene, and several other compounds.

One grab sediment/soil sample (RPC-SD-08) was collected from a low area by a large, stormdrain pipe on the west side of the facility (the pipe has a cut-off valve). The sample contained elevated levels of several pesticides, including 428 ppm of toxaphene, 321 ppm of p,p'-DDT, and 47 ppm of dieldrin.

#### Soil Samples

Two background soil samples were collected from commercial property north of Red Panther. RPC-SDS-03 was a surface sample and RPC-SDS-04 was a subsurface sample. Trace amounts of DDE, DDT, and dieldrin were detected in RPC-SD-03.

One subsurface grab soil sample (RPC-SB-09) was collected next to the wastewater collection pit at a depth of two to three feet. The collection pit is located next to the south tank farm.

This sample contained a number of pesticides, volatile organic compounds, and semivolatile organic compounds, including 1,130 ppm toxaphene, 245 ppm p,p'-DDT, 1,650,000 ug/kg of xylenes, and 250,000 ug/kg of ethyl benzene. The sample also contained 480 ppm of barium and 9.7 ppm of cyanide.

#### Groundwater Samples

Two groundwater samples were collected from wells at the Lewis Wilkens Generating Station. One of the samples (RPC-PW-02) was collected from Clarksdale public well #8 located at the station. The depth of this well is about 700 feet and the screened interval is about 590 to 690 feet.

The second water sample (RPC-CW-01) was collected from another well at the station (well #2). This well, and a number of other wells at the station, provide cooling water to the station and are screened in the Alluvial Aquifer.

No pesticides, PCBs, or organic compounds were detected in these samples. Barium (0.2 ppm), manganese (0.55 ppm) and magnesium (60 ppm) were detected in the cooling water sample. Manganese (0.04 ppm) and magnesium (32 ppm) were detected in the drinking water sample. All other metals were below detection limits.

19 0022

The (secondary) drinking water standard for manganese is 0.05 ppm.  
There is no drinking water standard for magnesium.

A shallow monitoring well at Red Panther was also sampled. This well was installed in 1989 by Southern Farmers Association, a company that was interested at the time in purchasing Red Panther (Reference 6).

No pesticides, PCBs, or organic compounds were detected in this sample (RPC-MW-05).

#### 6.0 RECOMMENDATIONS

The MS OPC recommends that an LSI evaluation be conducted on a medium priority basis.

1 9 0023

**RECONNAISSANCE CHECKLIST FOR HRS2 CONCERNS**

**Instructions:** Obtain as much "up front" information as possible prior to conducting fieldwork. Complete the form in as much detail as you can, providing attachments as necessary. Cite the source for all information obtained.

**Site Name:** Red Panther Chemical Co.

**City, County, State:** Clarksdale, Coahoma, Mississippi

**EPA ID No.:** MSD000272385

**Person responsible for form:** Ken Whitten, Jim Hardage, Mississippi Bureau of Pollution Control

**Date:** February 22, 1990  
Revised January 31, 1991

**Air Pathway**

**Describe any potential air emission source onsite:** N/A

**Identify any sensitive environments within 4 miles:** N/A

**Identify the maximally exposed individual (nearest residence or regularly occupied building workers do count):** N/A

**Groundwater Pathway**

**Identify any areas of karst terrain:** N/A

**Identify additional population due to consideration of wells completed in overlying aquifers to the AOC:**

Not applicable. The (surficial) Alluvial Aquifer is hydraulically connected to the (deeper) Sparta Aquifer in the Clarksdale area.

**Do significant targets exist between 3 and 4 miles from the site?**

There are numerous irrigation wells and home between 3 and 4 miles from the site.

**Is the AOC a sole source aquifer according to Safe Drinking Water Act: (i.e. is the site located in Dade, Broward, Volusia, Putnam, or Flagler County, Florida)**

No.

19 0024

Surface Water Pathway

**Are there intakes located on the extended 15-mile migration pathway?**

Yes, there are about 12 surface water intakes in the Sunflower River along the extended pathway. These intakes are used for about 383 acres of cotton, 806 acres of soybeans, and 90 acres of rice (Reference: MS Bureau of Land and Water Resources).

**Are there recreational areas, sensitive environments, or human food chain targets (fisheries) along the extended pathway?**

No. (References: Topo maps; U.S. Fish and Wildlife maps of endangered species).

Onsite Exposure Pathway

**Is there waste or contaminated soil onsite at 2 feet below land surface or higher?**

Yes. Results of 1990 SSI indicate on-site soil contamination and off-site sediment contamination in nearby ditches.

**Is the site accessible to non-employees (workers do not count)?**

No. Facility is fenced and access is controlled.

**Are there residences, schools, or daycare centers onsite or in close proximity?**

There is a school about 2,000 feet west of the site. There are residences west of the site.

**Are there barriers to travel (e.g., a river) within one mile?**

Yes. The Sunflower River is west of the facility. The above mentioned residences lie between the site and the Sunflower River.

## EPA ANNOUNCES THE AVAILABILITY OF THE ADMINISTRATIVE RECORD FOR THE RED PANTHER CHEMICAL SITE, CLARKSDALE, MISSISSIPPI

The United States Environmental Protection Agency announced today that the Administrative Record for the Red Panther Chemical Removal Site in Clarksdale, Coahoma County, Mississippi is available for public review.

The Administrative Record file includes documents that form the basis for selection of the removal action. Documents in the record may include, but are not limited to, preliminary assessment and inspection reports, test results, and the Action Memorandum. All interested persons are encouraged to review the documents and provide comments.

The documents will be available for public review during normal business hours at the following locations:

Carnegie Public Library  
114 Delta Avenue  
Clarksdale, MS 38614  
Attn: Missy Craig

U.S. EPA Records Center - Region 4  
Sam Nunn Atlanta Federal Center - 11<sup>th</sup> Floor  
61 Forsyth Street, SW  
Atlanta, GA 30303-3104  
Attn: Debbie Jourdan

EPA will accept comments regarding the Administrative Record during the public comment period, which begins on December 22, 2003 and ends on January 21, 2004. Comments should be addressed to Steve Spurlin, Federal On-Scene Coordinator, U.S. EPA Region 4, ERBB, 11<sup>th</sup> Floor, 61 Forsyth Street, S.W., Atlanta, GA 30303-3104. At the end of the 30-day comment period, a written response to all pertinent comments will be prepared in a responsiveness summary and placed in the file.

The Red Panther Chemical Site consists of 6.6 acres and is located at 550 Patton & Leflore Roads, Clarksdale, MS. The site is owned and operated by the Red Panther Chemical Company. Liquid and dry herbicides, insecticides, and fungicides were formulated at the facility between 1949 and 1978. During its operational period, wastewater from the formulating process was routinely released, which resulted in the property being highly contaminated with a wide variety of pesticides and arsenic. The site is currently used as a storage facility for seeds and farm chemicals.

- 10:11 Wayne Read <sup>pointed to</sup> wells are around his facility. And said that the well location of USGS map was wrong for the OARB well. This well is on his facility and not between the city wells and Red Panther.
- TD69 + KO37 wells are approximately 1025' apart & used for dewatering.  
Since these wells are so deep & not in the location of the USGS prioritized we decided not to sample.
- TD52 well is a ~~shallow~~ shallow well in the blue. A hazard for well drilling operations.

10:30 Headed back to Red Panther to start up or possibly have lunch.

Photographs 3 & 4  
are of the North side south  
of Red Panther.  
4 is the road spur.

(LP Gns)

- 10:52 Skip Gruber (Gruber Brothers, Inc.)  
said that we could take  
A background sample in  
the lot north of Red Panther.  
Ken said it might be  
approximately 3' deep.

0.1 MILES FROM LEFLORE AVE TO E. TALLAHATCHIE,

~ 12:15 pm - Broke for lunch.

Got back to Red Panther about 1:00 pm.  
Met w/ Jim Thomas.

THREE MONITOR WELLS WERE INSTALLED  
ABOUT ONE YEAR AGO. SOUTHERN FARMERS  
ASSN (based in Tenn.) was interested in  
buying Red Panther and had the wells  
installed. Wells were sampled once.  
Wells have not been sampled since.

TWO OF THE WELLS WERE PLUGGED AFTER  
THE INITIAL SAMPLING AND ANALYSES.

RED PANTHER DOES NOT HAVE THE  
ANALYTICAL RESULTS. THE ONE  
REMAINING MONITOR WELL IS A TWO INCH  
PVC WELL WITH A 4" SQUARE STEEL  
PROTECTIVE CASING w/ A LOCKING CAP.

THE WELL IS LOCATED NEXT TO WAREHOUSE  
#12 (NORTH SIDE OF WAREHOUSE). RED  
PANTHER DOES NOT HAVE A KEY TO THE  
WELL. Red Panther reps out the lock.

KEN WHITTEN, MIKE SLACK, & JIM HARDAGE  
TOOK WATER LEVEL MEASUREMENT w/ AN  
ELECTRONIC WATER LEVEL INDICATOR. DEPTH  
TO WATER FROM TOC\* 27 and 6/10 ft.

DEPTH FROM TOC\* TO BOTTOM OF WELL IS  
48 + 6/10 ft. DISTANCE FROM TOP OF OUTER  
(STEEL) CASING TO GROUND SURFACE 3' 8". AN  
ADDITIONAL ONE INCH TO TOP OF PVC CASING.

 Atlanta, Georgia 30365

Re: Red Panther Chemical Company  
 Coahoma County  
 Clarksdale, MS  
 MSD000272385

Dear Mr. Farrier:

Enclosed is the SIP for Red Panther. References used in evaluating the facility are listed at the end of this letter report.

Background

Red Panther Chemical Company is a pesticide formulating plant that has been operating since 1949. It is currently classified as a RCRA hazardous waste generator.

The Mississippi Office of Pollution Control (MS OPC) conducted a Site Investigation-Phase II at the facility in 1990.

Waste Characteristics

Test results from the SI-Phase II showed elevated levels of arsenic, toxaphene, and several other pesticides in soil and sediment samples but no contamination of groundwater samples from an on-site monitoring well and two nearby public wells.

NfRAP APPROVED  
 Low waste quantity  
 assumed due to lack  
 of data therefore score  
 is low.  
 bdy 1/3/92

~~ge~~ 2

#### Groundwater Pathway and Aquifer of Concern

The groundwater pathway was evaluated considering both an observed release and potential to release. The observed release was based on results of groundwater monitoring in 1989 which indicated arsenic in the groundwater underlying the facility. Subsequent sampling by the MS OPC in 1990 didn't detect arsenic in the one remaining monitor well.

The Alluvial and Sparta aquifers are probably hydrologically connected in the Clarksdale area. Therefore, they were considered as a single hydrologic unit. The estimated depth to the water table is twenty-four feet, based on a water level measurement from a monitoring well on-site. The lowest documented point of soil contamination is about three feet below land surface, based on sample RPC-SB-09.

Eleven Clarksdale public wells and twenty-two home wells are within four miles of the facility. Some additional wells are used for irrigation. These public and home wells provide water to a population of 20,349 people. The nearest well is a public well about 1,100 feet from the facility.

#### Surface Water Pathway

The surface water pathway was evaluated based on potential to release. Some surface water run-off from the facility drains into a drainage ditch along Leflore Avenue and Patton Street east of the facility. This ditch drains into another ditch along Hwy. 49, which intersects an intermittent stream that eventually flows into the Sunflower River. No drinking water intakes are located along the 15-mile pathway. Twelve intakes along the pathway are used for crop irrigation. The annual human food chain production rates for the Sunflower River were conservatively estimated at 20 pds/yr/acre. There are no sensitive environments, including wetlands, along the 15-mile pathway.

#### Soil Exposure Pathway

The soil exposure pathway was evaluated considering documented soil contamination within the work place property and within two-hundred feet of a work place area. The area of contamination was estimated to be 3,000 ft<sup>2</sup>. Workers are on site but there is no resident population. Access to the property is controlled.

#### Air Migration Pathway

The air migration pathway was not scored.

Page 3

Recommendation

Based on the score obtained from the SIP evaluation, this Office recommends that no further remedial action be planned for this facility. If you have any questions or comments concerning the evaluation, please contact Ken Whitten at (601) 961-5306.

Sincerely,

*Jim Hardage*

#### 15. Toxicity:

10,000

<u>Substance</u>	<u>Toxicity</u> (Hazard sub) (Ref. Table)
toxaphene	1000
(a) Xylene	10
ethyl-benzene	10
Aldrin	10,000
BARIUM	10,000
ARSenic	10,000
...	

A estimated size of individual houses across west delinquered on the topographic map.

Distance (miles)	* Population Range	Population	Value
0 - 1/4	100 - 300	100	Y <sub>4</sub> - Y <sub>3</sub>

Likelihood of Release

## 1. Observed Release:

In 1989, Chemical Analyses from monitoring wells 1 and 3, which no longer exist, contained elevated levels of Arsenic.  
{ Monitoring well #1 contained 83.6 ppb of Arsenic  
{ Monitoring well #3 contained 432 ppb of Arsenic}

Because no other sources can be identified in this area and MSMA herbicide was formulated at the facility, which Arsenic could be associated with the breakdown of MSMA, an observed release can be established to the Aquifer.

Observed Release: 550 . 550

CALCULATION OF HRS SCORE

Dear Mr. Moore:

The Tetra Tech EM Inc. Superfund Technical Assessment and Response Team (START) is submitting one copy of the letter report for the sampling investigation conducted at the Red Panther Chemical site in Clarksdale, Coahoma County, Mississippi.

If additional copies of the report or data sheets are needed, or you have any questions or comments regarding this letter report, please contact me at (770) 717-2305.

Sincerely,

*David L. Brown*

**LETTER REPORT  
RED PANTHER CHEMICAL  
CLARKSDALE, COAHOMA COUNTY, MISSISSIPPI**

**1.0 INTRODUCTION**

This report has been prepared in accordance with Technical Direction Document (TDD) No. 04-9905-0024, which the Region 4 U.S. Environmental Protection Agency (EPA) assigned to the Tetra Tech EM Inc. Superfund Technical Assessment and Response Team (START). Under this TDD, EPA tasked START to conduct an integrated site investigation at the Red Panther Chemical site to determine if it poses a threat to the surrounding population. Specific tasks included preparing a safety plan, conducting air monitoring, providing photographic and written documentation of site conditions and activities, preparing a site diagram, and collecting soil samples.

This report summarizes the site history, observations on site, sampling activities, and analytical results. Figures follow the text of the report and include a site location map, site layout map, and sample location map.

**2.0 BACKGROUND**

The site consists of approximately 6.5 acres and is located in Clarksdale, Coahoma County, Mississippi. The facility is bordered on the west by the Illinois Central Railroad tracks, to the south by a cement company, to the north by Graeber Farm Supply, and to the east by a used car lot. A residential area lies 0.25 mile west of the facility (see Figures 1 and 2).

The Red Panther Chemical facility began operations in 1949 as a pesticide production plant. The facility formulated liquid and powder herbicides, insecticides, and fungicides, including toxaphene, aldrin, arsenic, and DDT. Previous owners of the facility include Coahoma Chemical Company, Riverside Chemical Company, and MFC Services. Coahoma Warehousing is currently operating at the former Red Panther Chemical facility. The Red Panther facility filed a Resource Conservation and Recovery Act (RCRA) notification in 1980 for storage of wastewater and spent or used solvents in drums and tanks on site. Wastewater and solvents containing pesticide and solvent residues

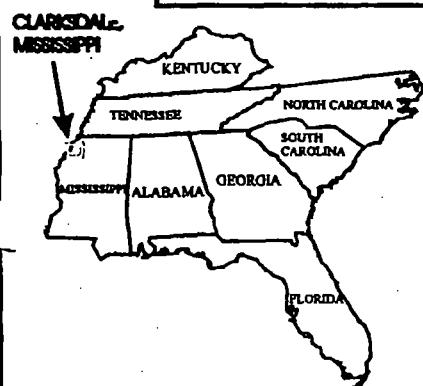

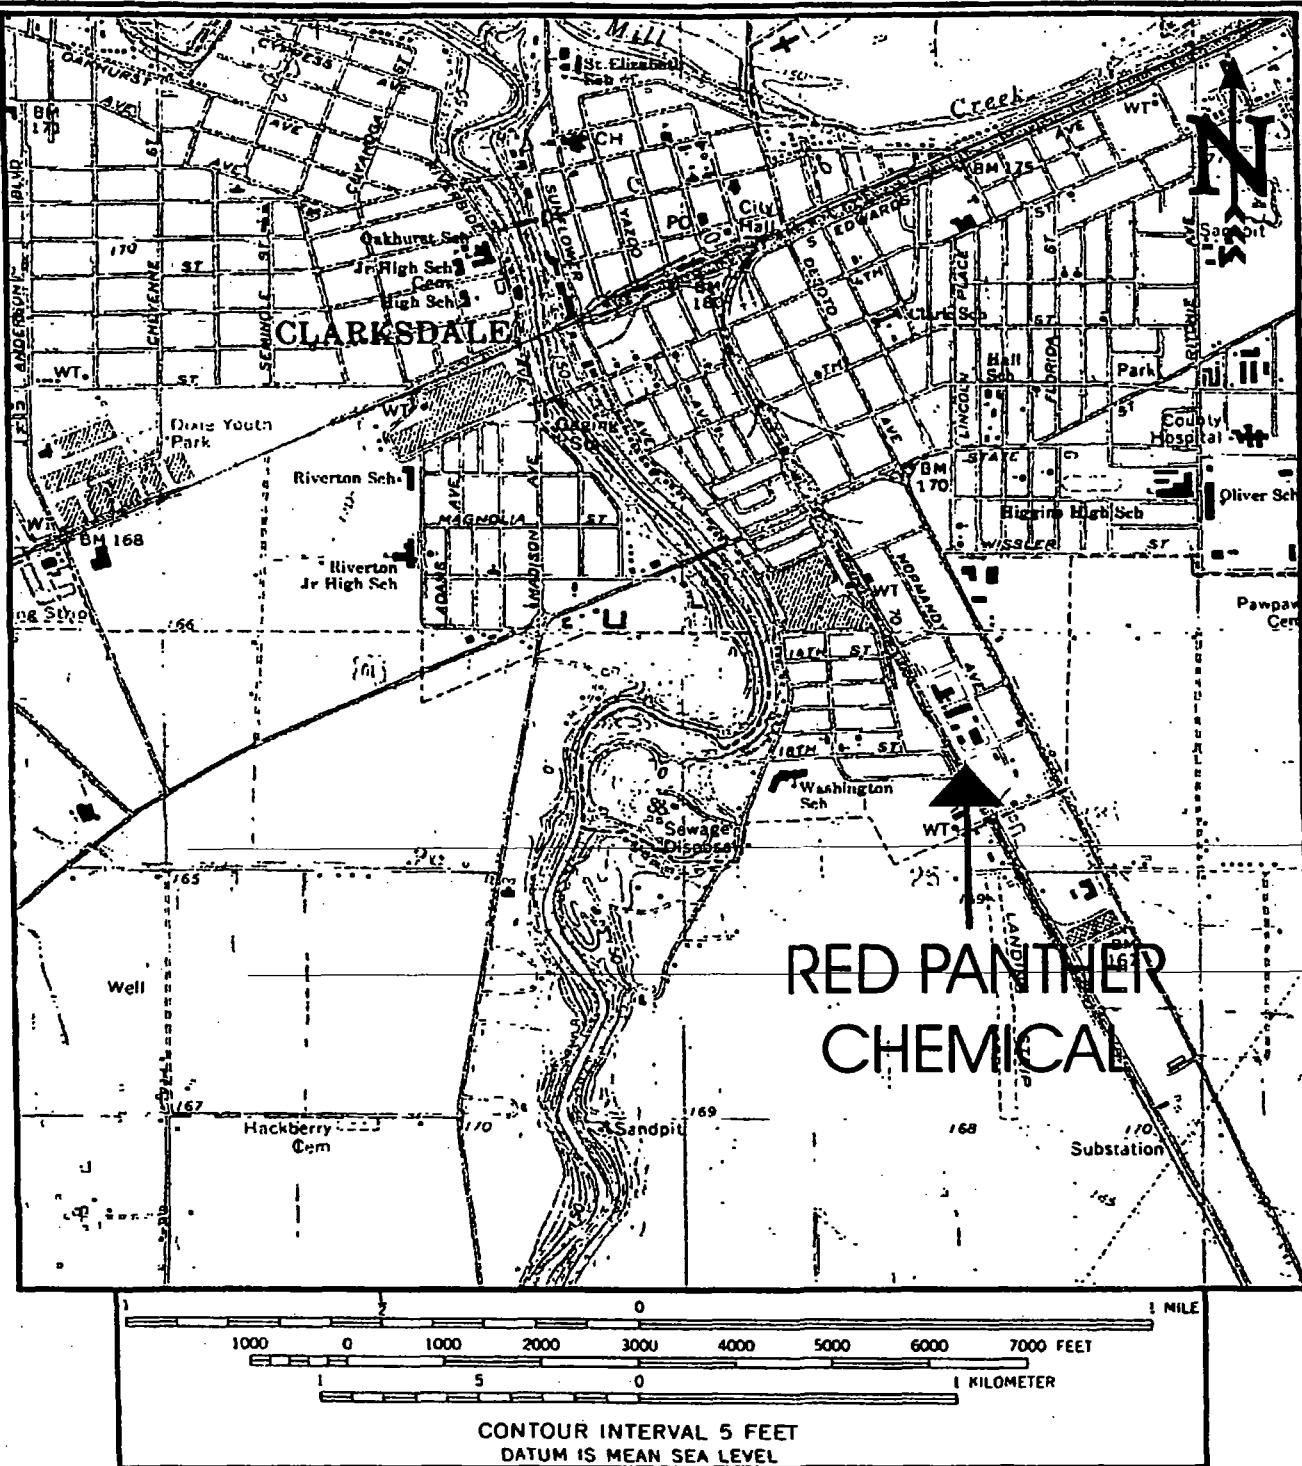

2 8 0005

residues were generated from the cleaning of equipment. The facility's RCRA Part A permit application listed wastes from site operations, including acetone, benzene, chlordane, chloroform, dichloromethane, methanol, and toxaphene. In November 1985, the facility obtained a RCRA Part B permit from the Mississippi Bureau of Pollution Control (MBPC) to store the wastewater and dirty solvents. Prior to that, wastewater from the formulating process was discharged either directly to a ditch off site or into an underground septic tank and drained on site.

MBPC performed a sampling inspection at the facility in August 1984. Environmental samples were collected to determine the presence of and characterize any hazardous substances at the site. Composite sediment samples were collected from the off-site drainage ditch adjacent to Normandy and Patton Streets, and composite subsurface soil samples were collected from an area around the septic tank and drain field. A water sample was collected from an area where wastewater discharged into the off-site ditch. Analysis of sediment and soil samples revealed detectable levels of pesticides and arsenic.

### 3.0 SUMMARY

START personnel mobilized to Clarksdale, Mississippi, on June 14, 1999, and met On-Scene Coordinator (OSC) De'Lyntoneus Moore on site the morning of June 15, 1999, to begin sampling activities (see Appendix A). START and OSC Moore established the sample locations on site (see Figure 3). OSC Moore indicated that three areas of concern (Areas A, B, and C) were associated with the site. Area A consists of the drainage ditches located across the street from the facility and adjacent to Normandy Avenue and Patton Street. During the previous formulating processes at the facility, wastewater was discharged directly into these ditches. START collected 12 surface and 12 subsurface grab soil samples at 50-foot intervals from Area A. All surface soil samples were collected from 0 to 3 inches below ground surface (bgs) with clean stainless-steel spoons and stainless-steel bowls. All subsurface soil samples collected from Area A were collected from a depth of 1-foot bgs with clean stainless-steel augers. The surface and subsurface soil samples collected from Area A were labeled RPA-01-SS through RPA-12-SS and RPA-01-SB through RPA-12-SB, respectively. Additionally, START conducted volatile organics screening across Area A. The background reading for the area was 2.5 parts per million (ppm). The volatile organics screening revealed one location at the intersection of Normandy Avenue and Patton Street with a reading of 202 ppm. The organics

SAMPLE LOCATION MAP

Tetra Tech EM Inc.

S-1-21

screening of subsurface soil samples in Area A revealed several areas with elevated concentrations.

On the morning of June 16, 1999, START personnel sampled Area B. Area B consists of the area where the former on-site septic tank and drain field reportedly received wastewater from the previous formulating processes at the facility. START collected five subsurface grab soil samples from within the northern portion of the former septic drainfield. START personnel advanced a power auger to sample depth at each of the Area B sampling locations, then collected each sample with stainless-steel augers. Subsurface soil sample RPB-05-SB was collected at the northeast portion of the former septic drainfield, at 12 feet bgs, where the water table was encountered. Subsurface soil sample PRB-04-SB was collected from the northwest portion of the former septic drainfield, at 9 feet bgs. Subsurface soil sample RPB-03-SB was collected from near the center of the former septic drainfield, at 6 feet bgs. Subsurface soil sample RPB-02-SB was collected near the southwest portion of the former septic drainfield, at 6 feet bgs. Subsurface soil sample RPB-01-SB was collected near the southeast portion of the former septic drainfield, at 3 feet bgs. Additionally, START conducted volatile organics screening across Area B. The background reading for the area was 2.5 ppm; the volatile organics screening revealed one location (RPB-01-SB) with a reading of 32 ppm.

On the morning of June 17, 1999, START personnel sampled Area C. Area C consists of the railroad spur located behind the facility at the loading dock area. OSC Moore established the sampling locations along the railroad spur. START collected 12 surface and 12 subsurface grab soil samples from along the railroad spur. All surface soil samples were collected from 0 to 3 inches bgs with clean stainless-steel spoons and stainless-steel bowls. All subsurface soil samples collected from Area C were collected from a depth of 1-foot with clean stainless-steel augers. Additionally, START collected one five-point composite surface soil sample (RPC-13-SS) from the railroad spur directly adjacent to a loading dock where, according to local residents, the product formulation took place. No readings above background were detected during the volatile organics screening across Area C.

All surface soils were collected from the site using clean stainless-steel spoons and stainless-steel bowls. In addition, all subsurface soil samples were collected with clean stainless-steel augers; one auger bucket was used to advance to depth, and a second auger bucket was used to collect the sample. Soils collected for RCRA metals and pesticides analysis were homogenized in a bowl and apportioned into the sample containers. Additionally, all samples were preserved on ice after collection. Samples were

2 8 0010

processed and packaged for delivery by START and shipped to Quanterra Environmental Services in Tampa, Florida, on June 16 and June 18, 1999.

#### 4.0 ANALYTICAL

All samples were analyzed for RCRA metals and pesticides. The analytical report is provided in Appendix B, and includes a summary of all contaminants identified. The source facility property is highly, but irregularly, contaminated with a wide variety of persistent organochlorine pesticides and their degradation products. Toxaphene, 4,4'-DDT, chlordane, aldrin, dieldrin, endosulfan II, and endrin were the most frequently found pesticides. Subsurface soil sample RPA-02-SB (Area A) was reported to contain 12 percent toxaphene plus substantial amounts (parts-per-thousand range) of several other organochlorine pesticides. Toxaphene is a complex mixture of at least 177 chlorinated compounds. In addition, the concentrations of arsenic in the samples varied from 7.4 milligrams per kilogram (mg/kg) in sample RPA-03-SB to 834 mg/kg in sample RPA-12-SS. This range of concentrations implies that arsenic is a contaminant, probably derived from pesticides. Of note, arsenic is found in two chemically distinct classes of pesticide. The inorganic salts, such as Paris green (copper acetoarsenite), are relatively insoluble in water and, therefore, have low environmental mobility. The organoarsenates (chemically analogous to the organophosphate insecticides and nerve agents), such as cacodylic acid (dimethylarsinic acid), are relatively water soluble and, therefore, more mobile.

Lead also has a wide concentration range indicative of contamination. However, the highest concentration in these samples is 142 mg/kg (in sample RPA-09-SS), well under the usual 400 mg/kg acceptable limit for lead in residential soil.

## 5.0 CONCLUSIONS

The purpose of this investigation was to determine whether the Red Panther Chemical facility posed an immediate threat to nearby residents. The facility is surrounded by commercial property; however, a residential area lies 0.25 mile west of the facility.

Coahoma Warehousing is currently operating on the former Red Panther Chemical property. In June 1999, START conducted a site investigation that included collecting surface and subsurface soil samples from the former Red Panther Chemical property. Analytical results indicated that the facility property is highly contaminated with a wide variety of persistent organochlorine pesticides and their degradation products. Toxaphene, 4,4'-DDT, chlordane, aldrin, dieldrin, endrin, and endosulfan II were the most frequently found pesticides. Additionally, the concentrations of arsenic in the samples collected from the site property implied that arsenic is a contaminant, probably derived from pesticides. The analytical results also revealed a wide concentration range for lead; however, the lead concentrations were below the acceptable limit for lead in residential soil. Therefore, lead may not be a concern; however, concentrations of arsenic (a known carcinogenic in humans) are above acceptable levels. As a result, arsenic is of concern at the site.

Future site activities will be based on future agreements between EPA and Coahoma Warehousing. No further START activity is anticipated under this TDD.

<sup>2</sup> Tuesday, June 15, 1999

0900 START personnel David Brown, Greg Kowalski, Jennifer Clements and Kristen Knoll arrive at the Red Particle site and meet with EPA OSC

1045 Moore, the facility is currently operating as Cachuma Warehousing. Mr. Moore explains task to be completed by ERB. START personnel do a walk through of the site property.

The site property is completely surrounded by barbed-wire fencing; however, the gate to the facility is open, adjacent to the Cachuma Warehousing office. START personnel are noting the site features on a site layout map derived from site file material obtained from EPA.

0950 START personnel complete site walk through. OSC Moore explained to

START personnel that there are three areas of interest. Area A: is the drainage ditch pathway along the front of the facility adjacent to Normandy Avenue. He requested that this drainage ditch be gridded off in 5.0 foot interval and to collect surface soil and 1-foot subsurface soil.

1030 START personnel have set up the grid on Area A.

1040 START collects the RPA-01-S1 sample approximately 3 feet from a discharge pipe which comes from the site property and discharges into the drainage ditch which comprises Area A. The sample collected from 3 inches depth sample consists of gravel / fines and black sandy clay.

1050 Photo taken at the RPA-01-S5, RPA-01-S8 sample location, begin augering for the subsurface soil when the wind is not blowing, pesticide odor in this area can be strong. The weather is sunny and breezy, temperature is  $\approx 75^{\circ}\text{F}$ , high temperature to reach  $82^{\circ}\text{F}$ .

1055 START collects the RPA-01-S8 sample from depth of 1-foot. Sample consists of a moist gray colored silty clay with a slight odor. Note: The Micro FID is reading 2 ppm for background conditions at area A readings are 0.8 ppm, it is breezy.

1115 START begins to collect the RPA-02-55 Sample.

1125 AIR MONITORING W/ THE FID RESULTS:

BEGEND 2.5 PPM

ABOVE SAMPLE 1.5 PPM

AMBIENT FLUCTUATING FROM 1.2 - 1.8

WIND COMING FROM EAST (OFF SITE)

PARTICULATE MONITOR RESULTS:

BEGEND: 0 - 0.1 mg/m<sup>3</sup>

AT SAMPLING LOCATION = 0 - 0.1 mg/m<sup>3</sup>

STAY WALKS EAST OF SAND LOCATION

AND FID READINGS CHANGE TO 8.5 PPM.

This location is away from SITE & UPWIND OF SITE.

1135 Begendo Logs North Sample Pt. = S. 9, E. 1

1140 Collect RPA-02-5B, Soil Holes Good

FROM A BROWN SANDY CLAY ON SURFACE, TO

A BLACK CLAY AT X 10". START SWITCHES

TO A CLEAN BUCKER & CALLS THE SAMPLE FROM 12"-16"

○ A RESTRICTION LIKE OODR IS NOTICED, BUT NO INCREASSE IN MONITORING FID RR.

○ PLACE FID IN BORING & READ 74.1 PPM ~

○ DUE TO THE OODR & LOST LOGS, START WILL

○ COLLECT REMAINING SUBSAMPLES IN MOISTENED LINER C.

1220 Collect RPA-03-55 From East Ditch

1230 Begin Drawing To 1' Bgs. Soil Becomes A Black Clay At X 8".

1255 START COLLECTS RPA-04-55 WHERE THE EAST DITCH MEETS THE NORTH/SOUTH DITCH

Soil Holes / 3 A DARK GREY SANDY CLAY.

1300 BORE DOWN TO 1', SOIL IS THE SAME, NO FID READS ABOVE 5 PPM FROM BORING

1305 Collect RPA-04-5B From Same Loc. Of 04-55 At 12"-16" Soil Holes / 3 A Dark Grey Clay (Course Clay) That Is Very Sticky/Fract.

SPARSE VEGETATION IS FOUND IN THE EAST DITCH →

Area No Vegetation Is In The North/South Ditch. This Area Is The Low Spot And Water Appears To Pool Here Before Reaching A "Silloxor" Culvert, Taking Runoff North Across Street.

1310 START perform preliminary decon on sample equipment before breaking for lunch.

1510 START personnel are at the RPA-05-SS, RPA-05-SB sample location located at the drainage culvert at intersection of Patton Street & LeFlore.

1515 START collect the RPA-05-SS Sample from 3" depth, Soil consists of a sandy clay with a slight odor. Note: There have not been any birds or worms encountered in any of the soils collected with Area A.

1525 START collects the RPA-05-SB Sample, Sample collected 12"-16", soil consisted of gray silty clay with slight odor. Sampling still conducted in Level C PPE.

1535 START collects the RPA-06-SS Sample in front of another drainage pipe.

1536 The RPA-06-SS soil consists of sandy sedimentary deposit for the first inch and followed by black colored clay at 3" depth. Note: Photo taken at the RPA-05-SB location.

1540 START collects the RPA-06-SB Sample from depth of 12", Soil consists of gray colored clay with odor.

1545 START collects the RPA-07-SS Sample collected in front of yet another drain pipe within this drainage system the soil consists of a brown colored, soft, no odor detected.

1600 START collects the RPA-07-SB Sample from the 1-foot depth, the MicroFID is registering 74 ppm in the borehole at this location, START is in Level C PPE, soil consisting of gray clay with odor.

1630 START collects the RPA-08-SS Sample from 3" depth, soil consists of a brown colored silty clay.

1640 START collects the RPA-08-SB Sample from 1-foot depth, the MicroFID reads 202 ppm in borehole.

1641 The RPA-08-SB sample consist  
of brown silty clay.

Note: START Collected the RPA-12-  
SS sample <sup>on</sup> about collected at  
1640, collected by Clements and Kroll.

Sample collected from depth of  
3 inches, sample consists of silty clay.  
Photograph taken at this location.

1650 START Collects the RPA-09-SS  
sample from 3" depth, sample

consists of gray clay/silty sand,

1655 START Collect the RPA-09-SB  
sample, the sample was collected from  
a depth of 1-foot, sample consists of  
a gray silty clay, Micro-FID

reading 0.8 ppm at this borehole.

1700 START personnel Clements and  
Kroll Collect the RPA-11-SS sample  
from 3" depth, soil consists of silty  
clay. Photograph taken at this location.

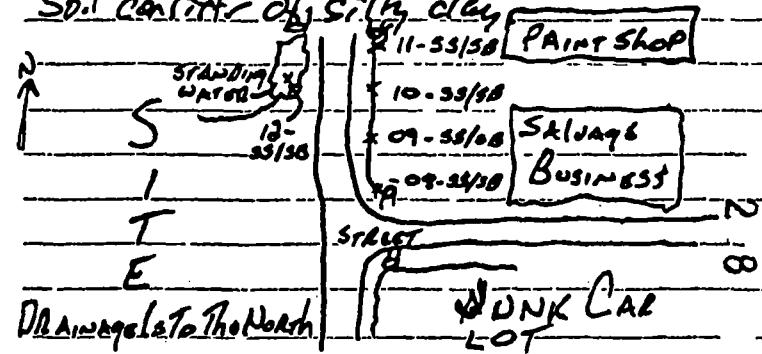

MICRO FID reading 0 ppm at borehole

1705 START Collect the RPA-11-SB  
sample from 1-foot depth, same  
sample type.

1705 START Mabdo-Kawaldi collects  
the RPA-10-SS sample from 3" depth,  
soil consists of brown silty clay no ab.

1710 START collects the RPA-10-SB  
soil consists of brown silty clay, FID  
reading 0 ppm in the borehole,  
sample collected from 1-foot depth.

1711 Note: RPA-12-SB collected at  
1645 so:1 collected from 1-foot interval,  
soil consists of silty clay

1900 START personnel complete decom-  
of equipment and sample manage-  
activities and return to hotel, end  
of day.

R. P. 4/15/99

Wednesday, June 16, 1999

0730 START personnel meet and prepare samples that were collected yesterday for shipment to the laboratory.

0800 START personnel arrive at the Red Panther site, and ask security to unlock gates so that we can obtain access to the site property. OSC Tong Moane is not on site currently. The weather is partly cloudy, temperature is  $\approx 73^{\circ}\text{F}$ , high temperature to record  $83^{\circ}\text{F}$ .

0820 START personnel setting up for today's activities in Area B which is the location of the former septic field.

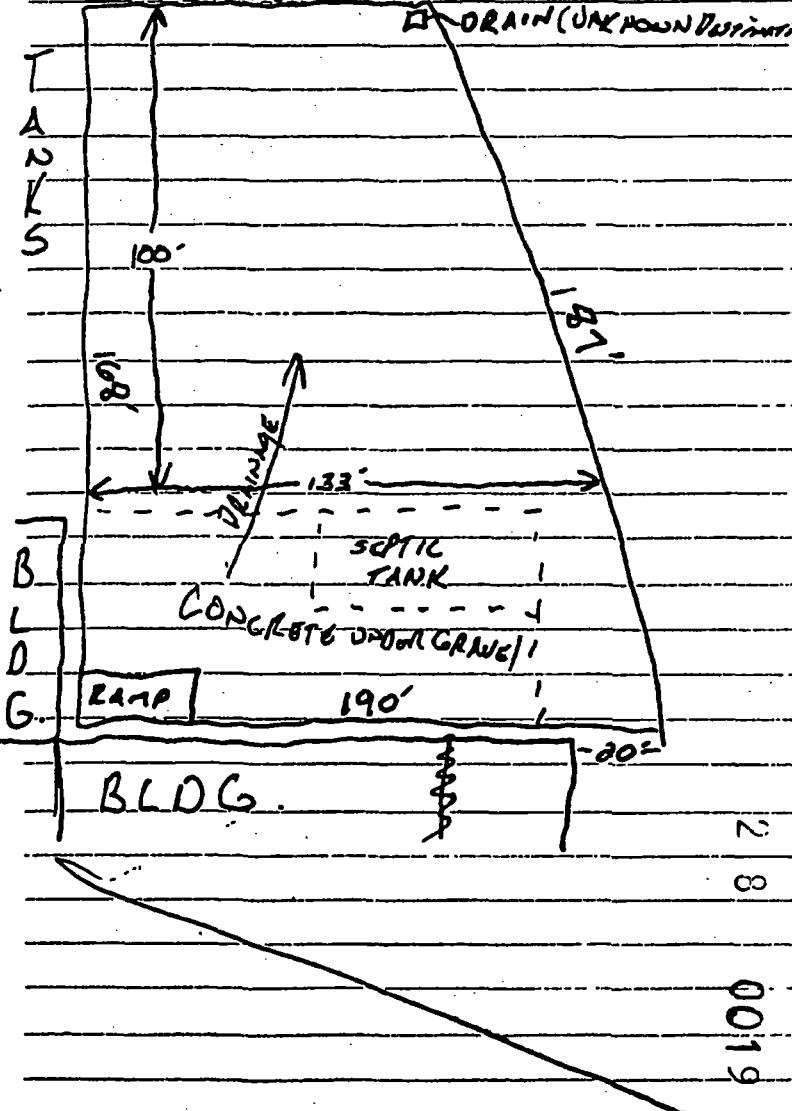

0840 START personnel are using shovels in Area B to scrape away a layer of gravel that has been spread over the entire area of the former septic field, in doing so START will attempt to discover the location of the septic tank.

1000 START has determined the location of the septic tank (Area B 60' x 60')

Ag. 610 Septic Field

38'

DRAIN (JAK POND DRAINING)

In 1050 START personnel have marked the location for the five-point sample area for sampling in the former septic drain field area. START personnel have been using shovels and hand auger trying to penetrate the surface of this area and have had auger refusal repeatedly, will now attempt to use the Little Beaver power auger in this area.

1125 START personnel have power augered to a depth of 9 feet at the RPB-05-SB sample location, the designated sample depth is to be 25 feet. START personnel are air monitoring with Micro FID which is reading 2.5 ppm in the borehole. START working in Level D PPE. The sample location is located near the northeast corner (approx 5 feet) of the septic field area. The power auger encountered auger refusal at 9 feet using maximum power. START will continue to hand auger to attempt to reach sample depth. Photo taken air monitoring borehole, 2.5 ppm.

1200 START personnel have augered to a depth of 12 feet at the RPB-05-SB location, groundwater encountered at this depth. START makes call to OSC Moore and informs of the situation, OSC Moore instructs START to collect the subsurface soil at 12 feet rather than 25 feet, he also stated that START should collect the remainder of the sample at: (1) 9 feet (2) 6 feet and (1) 3 feet.

1220 START collects RPB-05-SB from 12 feet depth, the sample is very wet, the sample consists of very dense brown/gray clay, sample collected 23' west of the eastern wall and 19' south of the northern wall. The Micro FID reading is 2.7 ppm from the borehole.

1240 OSC Moore arrives on site, START preparing to auger at the RPB-04-SB which is located 25' south of north wall and 35' east of west wall. Photo taken RECON OF AREA REVEALS THAT THE NEAREST SCHOOL IS B.T. WASHINGTON

ELEMENTARY SCHOOL  $\approx$  1/2 - 1 MILE  
WESTERN SOUTH OF THE SITE. START  
MUST COLLECT SAMPLES FROM ADJACENT  
RESIDENCES ( $\leq$  200' FROM SITE), TO  
DATE NO RESIDENCE HAS ALLOWED THEIR  
YARD TO BE SAMPLED. RE: HOME  
OWNER NOT PRESENT FOR DISCUSSION.  
MAY BE ABLE TO COLLECT SAMPLE  
FROM RIGHT OF WAY INSTEAD OF  
YARD.

THE CHILDREN OF THE ADJACENT NEIGHBOR-  
HOOD USE THE LPG FIELD AS WELL AND  
THE LEFLORE - PATTON AREA AS  
SHORT CUTS TO THE STORES ON  
HWY 49. NOTE: DITCHES ALONG LEFLORE  
DISPLAY CONTAMINATION AT PRESENT. —

1330 START personnel have augered to  
a depth of 9 feet at the RP-02-SB  
location and are collecting the sample  
which consists of a light brown/gray  
clay, slight odor. Sample collected  
in Level C protection, photo taken at  
this location. Micro FID reads  
2.7 ppm in borehole

1540 START personnel are at the  
RP-03-SB location and are utilizing  
Little Beaver Power Auger, photograph  
taken here, START to auger to 6-foot  
depth.

1610 START collects the RP-03-SB  
sample from a depth of 6-foot, Micro  
FID reads 0.0 ppm from the borehole.  
Soil consists of brown sandy clay with  
no odor. Note: There is a paint  
facility located adjacent to the site which  
is spraying paint/finner into the air  
while paint application is occurring,  
photograph taken.

1615 Note: The RP-03-SB sample is located  
45' south of North wall and 55'  
east of West tank impoundment line.

1635 START has power augered to a  
depth of 6-feet at the RP-02-SB  
location to begin hand augering to clean  
out hole and collect sample, Micro FID  
reading 0.0 ppm from borehole.

1650 START collects RP-02-SB, sample  
consists of gray/brown clay, sample located  
65' south of North wall & 78' east of West wall.

1705 START personnel have power augered to a depth of 3 feet at the RPB-01-SB location, will clean out borehole with hand auger and collect sample. Micro FID reading 32 ppm from borehole.

1715 START collects the RPB-01-SB Sample from 3-foot depth, sample consisted of dark gray clay with no odor. Sample located 41' east of West wall and 67' south of North wall.

1730 START begins site breakdown activities and equipment decon.

1930 START personnel arrive back at hotel, end of day.

Thursday, June 17, 19

0730 START personnel meet and prepare sampler for shipment to the laboratory.

0845 START arrives onsite, the weather is sunny, temp. 267°F., High temp to reach 83°F., it is breezy, crew to begin setting up for today's activities.

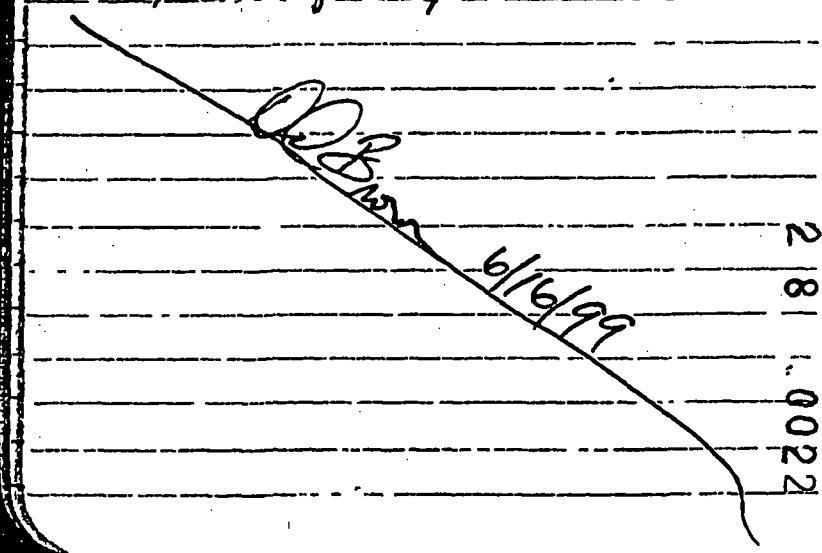

1005 START PERSONNEL ARE ON THE RAILROAD SPUR BEHIND THE FACILITY AT THE LOADING DOCK. THIS AREA IS REFERRED TO AS AREA C. THERE IS A SLIGHT ODOR AND THE AREA IS MODERATELY VIBRATED.

1010 START PERSONNEL COLLECT RPB-01-SS. THE SOIL TYPE AT 3 INCHES IS SANDY w/ PEBBLES AND DARK COLOR, NO ODORE. THIS SAMPLE IS CLOSEST TO THE LOADING DOCK.

1015 START PERSONNEL COLLECT RPB-01-SB. THE SOIL TYPE IS DARK w/ PIECES OF GLASS / COAL.

START PERSONNEL ARRIVED TO 12".

1020 START PERSONNEL COLLECT RPB-02-SS. THE SAMPLE IS

6/17/99

LOCATED BETWEEN THE TRACKS. THE SOIL TYPE IS A MIXTURE OF GRAVEL & DARK SOIL, SILTY AT APPROX. 6", NO ODOR.

10:35 START PERSONNEL COLLECT RPC-02-SB FROM THE SAME LOCATION AND SOIL TYPE AS RPC-02-SS. NO ODOR. AUGURED THROUGH BALAST TO 12" b/s.

1040 START PERSONNEL COLLECT RPC-03-SS. THIS SAMPLE IS FURTHEST FROM THE LOADING DOCK. IT WAS COLLECTED AT 3". THE SOIL TYPE IS BROWN SILTY SOIL w/ ROCKS MIXED IN. NO ODOR.  
NOTE: THERE IS A TRANSFORMER ON A TELEPHONE POLE NEAR THIS LOCATION.

1045 START PERSONNEL COLLECT RPC-03-SB. IT HAS THE SAME SOIL TYPE AND LOCATION AS RPC-03-SS. THIS SAMPLE IS LOCATED AT 12" b/s.

1105 START PERSONNEL COLLECTS RPC-04-SS AT 3" b/s. SOIL TYPE IS DARK SILTY SOIL w/ GRAVEL.  
NOTE: OSC FLAGGED SAMPLE POINT

ON CROSSTIE. START PERSONNEL ADJUSTED THE POINT. SAMPLE IS LOCATED ADJACENT TO CROSSTIE AND IS CLOSEST TO THE LOADING DOCK. NO ODOR. SLIGHT BREEZE. PHOTO WAS TAKEN AT RPC-04-SS.

1120 START PERSONNEL COLLECTED RPC-04-SB. THE SAMPLE LOCATION & SOIL TYPE ARE THE SAME AS ~~TO~~ RPC-04-SS. THE SAMPLE WAS TAKEN AT 12" —  
NOTE: SOIL TYPE CHANGED TO BLACK DAMP, SANDY SOIL

1125 START PERSONNEL COLLECTED RPC-05-SS. FROM THE MIDDLE OF THE TRACKS. SOIL TYPE BROWN SANDY SOIL MIXED w/ ROCK. SAMPLE TAKEN AT 3" b/s NO ODOR. NOTE: WINOY

1130 START PERSONNEL COLLECTED RPC-05-SB. AT THE SAME LOCATION AS RPC-05-SS. SOIL TYPE IS THE SAME AS RPC-05-SS. SOIL TYPE CHANGED AT 12" b/s TO BLACK, DAMP, SANDY SOIL

20

6/17/95

1140 RPC-06-SS WAS COLLECTED BY START PERSONNEL. THIS SAMPLE IS LOCATED A FARTHEST FROM THE LOADING DOCK. SOIL TYPE IS BROWN SILTY SOIL W/ GRAVEL. THE SAMPLE WAS TAKEN FROM 3" BLS.

1145 START PERSONNEL COLLECTS RPC-06-SB. IT IS AT THE SAME LOCATION AS RPC-06-SS. SOIL TYPE IS DARK IN COLOR W/ PIECES OF METAL AND DEBRIS. NO ODOR.  
NOTE: THIS SECTION OF THE RAILROAD SPUR IS CLOSEST TO THE LARGE STORAGE TANKS ON THE NORTH WEST SIDE.

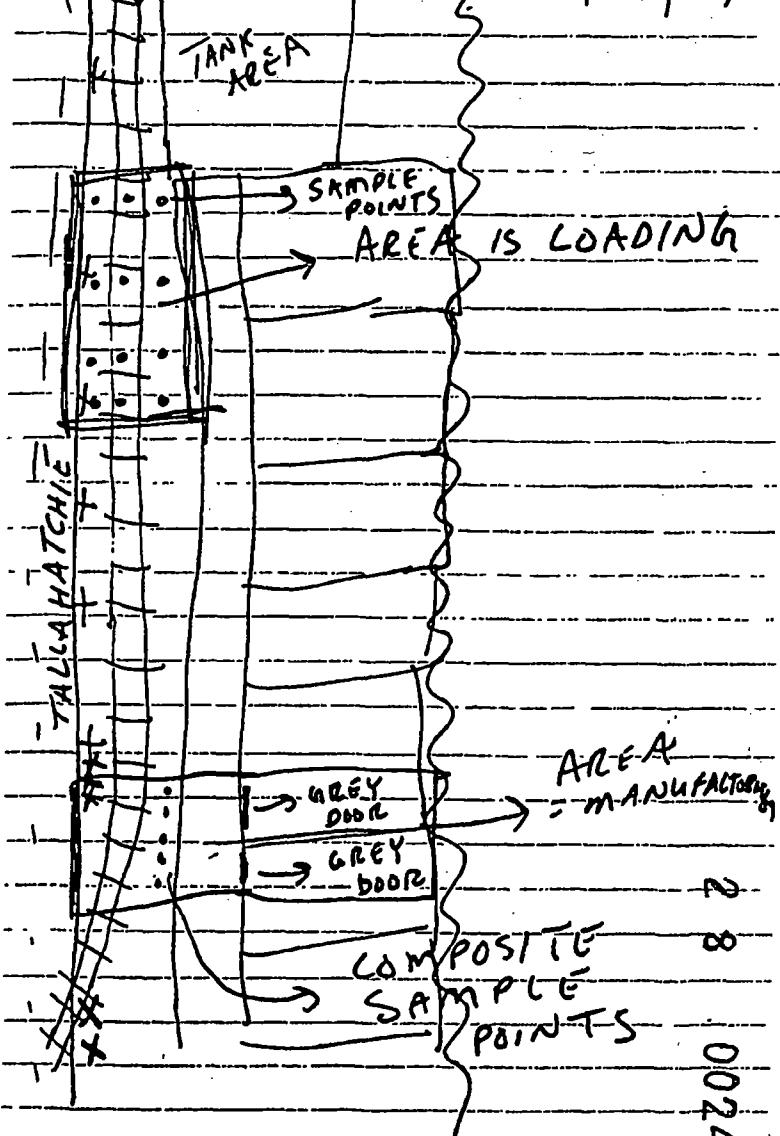

1150 OSC ARRIVES AND INSTRUCTS START TO TAKE A COMPOSITE SAMPLE FROM AN AREA THAT IS BELIEVED TO BE A MANUFACTURING LOADING BAY.

Dear Mr. Moore:

Data evaluation was performed on the analytical data for 54 soil samples collected by Tetra Tech EM Inc. (Tetra Tech), at Red Panther Chemical site. The samples were analyzed under sample delivery groups (SDG) B9F170172 and B9F190126 by Quanterra, Inc., of Tampa, Florida. The samples were analyzed for pesticides and inorganic chemicals using U.S. Environmental Protection Agency (EPA) methods SW-846 8081A, 6010B, and 7471A. The summary data packages were evaluated in accordance with the "U.S. EPA Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review," dated February 1994, and were based on the following parameters:

- Data Completeness
- Holding Times
- Calibrations

Mr. De'Lyntoneus Moore  
August 9, 1999  
Page 2

Red Panther Chemical  
SDGs B9F170172 and B9F190126

- Blanks
- Surrogate recoveries
- Matrix spike/matrix spike duplicates (MS/MSD) and matrix duplicates
- Laboratory control samples (LCS)
- Compound quantitation
- Compound identification

Table 1 summarizes the qualified data results.

#### I. DATA COMPLETENESS

The data packages for SDGs B9F170172 and B9F190126 were complete.

#### II. HOLDING TIMES

The holding times were met for the samples.

#### III. CALIBRATIONS

The initial and continuing calibrations were analyzed at the proper frequencies and concentrations and met all requirements, except for one minor irregularity for one surrogate in a continuing calibration. No qualifications are warranted.

#### IV. BLANKS

The calibration blanks were free of target analytes.

#### V. SURROGATE RECOVERIES

Surrogate recoveries were generally acceptable, when measurable; however, most pesticide analyses (each sample received three analyses, one for chlordane, one for toxaphene, and one for the other analytes) required dilutions of 10-fold to 200,000-fold, so the surrogate recoveries could not be determined. No qualifications are warranted.

Mr. De'Lyntoneus Moore  
August 9, 1999  
Page 3

Red Panther Chemical  
SDGs B9F170172 and B9F190126

## VI. MATRIX SPIKE/MATRIX SPIKE DUPLICATES AND MATRIX DUPLICATES

The MS/MSD analyses for the pesticides were not usable. Each selected sample (RPA-09-SS, RPC-01-SS, and RPC-11-SB) contained at least one analyte in such quantity that the spikes were below the sample detection limit when the sample was diluted to bring the contaminant concentrations within calibration range.

The MS/MSD analyses of the inorganic analytes (metals) were generally within the acceptable range. However, in the analysis of sample RPA-08-SS, the arsenic recoveries were 163 percent in the MS analysis and 61 percent in the MSD analysis, both unacceptable. This anomalous result is probably due to variations in the arsenic concentration in the sample. In the MS/MSD analysis of sample RPB-01-SB, both barium recoveries were high, and both chromium and selenium recoveries were low. These results probably reflect matrix interference. In all the above cases, the results for the affected metals in those samples are considered estimates and flagged "J" to indicate that.

## VII. LABORATORY CONTROL SAMPLES

The results obtained for the target analytes in the analysis of the LCSs were within control limits.

## VIII. COMPOUND QUANTITATION

Sample results were spot checked for proper dilution factors, volumes, and dry weight corrections. Calculations were acceptable. The raw data for a majority of the samples showed interference from target and non-target chemicals, requiring dilutions of up to 200,000-fold for the pesticide analyses and up to 15-fold for the metals analyses.

In the pesticide analyses, overlapping peaks and raised baselines required manual integration in many samples. The laboratory examined each peak carefully and used the "cleanest" one for each quantitation. The results appear to be the best possible for such highly contaminated samples.

In the metals analyses, the major complication was spectral interference, mostly from calcium and iron, which are present in high concentrations in most samples. Dilution of the sample extracts eliminated this problem.

Mr. De'Lyntoneus Moore  
August 9, 1999  
Page 4

Red Panther Chemical  
SDGs B9F170172 and B9F190126

## IX. COMPOUND IDENTIFICATION

Results are acceptable. Note, however, that absolute identification is not possible with this method of pesticide analysis. As an extreme case, consider sample RPA-02-SB, which was reported to contain 12 percent toxaphene plus substantial amounts (parts per thousand range) of several other organochlorine pesticides. Toxaphene is a complex mixture of at least 177 chlorinated compounds. It is possible that at least some of the other non-toxaphene pesticide results are toxaphene components, either partially or entirely. However, the same other non-toxaphene pesticide results were seen in many samples in similar concentration ratios, so the results in sample RPA-02-SB may be completely accurate.

Many of the pesticides appear to have been significantly degraded by their environmental exposure. During calibration it was noted that about 2 or 3 percent of the 4,4'-dichlorodiphenyltrichloroethane (4,4'-DDT) put on column was degraded to 4,4'-dichlorodiphenyldichloroethane (4,4'-DDD) and 4,4'-dichlorodiphenyldichloroethylene (4,4'-DDE) during the analysis. This same reaction is the most common environmental degradation mechanism for 4,4'-DDT, and in most samples, some 20 to 30 percent had been degraded. Similar degradation results would be expected for all the pesticides.

## X. OVERALL ASSESSMENT OF DATA

The overall quality of this data package was acceptable. Results are as good as can be expected from such samples.

The source facility is highly, but irregularly, contaminated with a wide variety of persistent organochlorine pesticides and their degradation products. Toxaphene, 4,4'-DDT, chlordane, aldrin and dieldrin, endrin, and endosulfan II were the most frequently found pesticides.

The concentrations of arsenic in the samples vary from 7.4 milligrams per kilogram (mg/kg) in sample RPA-03-SB to 834 mg/kg in sample RPA-12-SS. This range of concentrations implies that arsenic is a contaminant, probably derived from pesticides. Of note, arsenic is found in two chemically distinct classes of pesticide. The inorganic salts, such as Paris green (copper acetoarsenite), are relatively insoluble in water and, therefore, have low environmental mobility. The organoarsenates (chemically analogous to the organophosphate insecticides and nerve agents), such as cacodylic acid (dimethylarsinic acid), are relatively water soluble and, therefore, more mobile. Either the facility history or special

2 3 . 0032

Mr. De'Lyntoneus Moore  
August 9, 1999  
Page 5

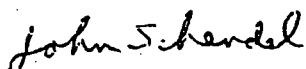

Red Panther Chemical  
SDGs B9F170172 and B9F190126

analyses should be used to determine if the site contamination includes one or both groups of arsenic-containing pesticides.

Lead, too, has a wide concentration range, indicative of contamination. However, the highest concentration in these samples is 142 mg/kg (in sample RPA-09-SS), well under the usual 400 mg/kg acceptable limit for lead in residential soil. Therefore, lead may not be a concern, although arsenic (known to be carcinogenic in humans) is definitely a major concern at this site.

If you have any questions or need further information, please contact me at (404) 225-5516.

Sincerely,

John Schendel

Data Validation Chemist

## EXECUTIVE SUMMARY

This report presents the results of the Phase I Removal Action conducted in November and December of 2002 at the Red Panther Superfund Site in Clarksdale, Mississippi. The Removal Action was conducted pursuant to the Administrative Order on Consent (AOC) for Removal Action, Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Docket No. CER-04-2001-3776 between Environmental Protection Agency (EPA) Region IV and a group comprised of a number of parties identified by EPA as Performing Potentially Responsible Parties (Performing PRPs). The AOC required the remediation at the Red Panther Site be conducted in two phases. Phase I consists of the following four components:

- Excavation of surface soils from drainage ditches between the Red Panther property boundaries and Route 49 and the disposal or temporary stockpiling of the excavated material,
- Characterization of onsite soils and the remaining ditch soils,
- Design of Phase II removal activities, and
- Preparation of a Phase II Work Plan detailing additional removal tasks necessary to complete the requirements of the AOC.

The scope of work for the Phase I Removal Action was to excavate the surface soils from Ditches 1, 2, 3, and 4, perform confirmation sampling after the soils were removed, and to erect a security fence around Ditches 5 and 6 to prevent access to the ditches. The objective of the ditch soil removal action was to remove the surface and subsurface ditch soils exceeding the performance standards and to limit access to Ditches 5 and 6 until the impacted soils in these two ditches can be removed during Phase II.

The ditch characterization activities were performed from June 24, 2002 through June 27, 2002. The purpose of the ditch sampling was to compare the analytical results to the performance standards, estimate the amount of soil that would require excavation to meet the performance standards, and to evaluate disposal options for the soils to be excavated. Six ditches (designated 1 through 6) were sampled during the characterization activities. The ditch characterization data indicated that the concentrations of total chlorinated pesticides and dieldrin in the surface soils of Ditches 1 and 2 generally exceeded the performance standards whereas the concentrations of total chlorinated pesticides, dieldrin, and toxaphene in Ditches 3, 4, 5, and 6 did not exceed the performance standards. Arsenic was detected in lower concentrations in Ditches 1 and 2, and in higher concentrations in Ditches 3, 4, 5, and 6. The arsenic concentrations in all six ditches exceeded the performance standards. The soils (0-2-foot interval) in Ditches 1, 2, 3, and 4 did not exceed the TCLP regulatory limits for the full TCLP parameter list except for the 0-1' foot interval in Ditch 4. Tetrachloroethene was detected at 0.87 milligrams per liter (mg/L) in the 0-1' foot interval in Ditch 4, which barely exceeded the TCLP regulatory limit of 0.7 mg/L. Based on the TCLP testing, a majority of the soils in Ditches 1, 2, 3, and 4 were nonhazardous and could be disposed at a Subtitle D Landfill.

A majority of the soils in Ditches 5 and 6 exceeded the TCLP regulatory limit for arsenic (5.0 mg/L). Disposal of soils in Ditches 5 and 6 that exceed TCLP criteria for arsenic are subject to the hazardous waste and land disposal regulations.

The Phase I Removal Action was performed in November and December of 2002.

Approximately 900 tons of soil were removed from four (Ditches 1, 2, 3, and 4) of the six drainage ditches. Of the excavated soil, 825 tons were disposed in the Waste Management Subtitle D Tunica Landfill in Robinsonville, Mississippi. Approximately 75 tons of soil exceeding the TCLP criteria were excavated from Ditch 1 (2-3 foot interval) and stockpiled onsite and secured. These soils will be addressed during Phase II.

Once each ditch had been excavated to 2 feet (except for Ditch 1), composite confirmation samples were collected. The samples were sent to Test America Laboratories in Nashville, Tennessee for analysis. The confirmation samples were analyzed for arsenic, dieldrin, and toxaphene (COCs for subsurface soils). After the ditch confirmation sample data was received the 95% Upper Confidence Limit (UCL) of the mean ditch domain concentration was calculated. Ditches 3 and 4 were approved for backfilling. Portions of Ditches 1 and 2 still exceeded the performance standards and required additional soil removal. An additional 1-foot interval was excavated from these portions of Ditches 1 and 2 and confirmation samples were collected over the areas of additional excavation. The 95% UCL of the mean ditch domain again failed the subsurface performance standards for toxaphene and dieldrin. This issue will be addressed during Phase II.

Heavy rains filled the ditches (mainly 1, 2, 3, and 4) several times during the backfilling process, complicating the excavation and backfilling process. The storm water was pumped from the ditches and stored in a frac tank onsite and sampled to determine disposal options. The storm water contained concentrations of pesticides, which were above the standards that the local POTW would accept. The storm water was subsequently transported to Excel TSD, Inc. in Memphis for final treatment and disposal as a non-hazardous non-regulated liquid.

During the removal action, approximately 350 feet of 6-foot high chain-link fence was removed from the north end of the property along Ditches 5 and 6 and disposed offsite. A new 6-foot high chain-link fence, with three-strand barbed wire, was installed north of Ditches 5 and 6 to prevent public access.

## **1.0 INTRODUCTION**

This report presents the results of the Phase I Removal Action conducted in November and December of 2002 at the Red Panther Superfund Site in Clarksdale, Mississippi. The Removal Action was conducted pursuant to the Administrative Order on Consent (AOC) for Removal Action, Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Docket No. CER-04-2001-3776 between Environmental Protection Agency (EPA) Region IV and the Performing PRPs. The AOC required the remediation at the Red Panther Site be conducted in two phases. Phase I consists of the following four components:

- Excavation of surface soils from drainage ditches between the Red Panther property boundaries and Route 49 and the disposal or temporary stockpiling of the excavated material,
- Characterization of onsite soils and the remaining ditch soils,
- Design of Phase II removal activities, and
- Preparation of a Phase II Work Plan detailing additional removal tasks necessary to complete the requirements of the AOC.

This report presents the results of the drainage ditch characterization and the excavation and disposal of the drainage ditch soils.

### **1.1 Background Information**

The Red Panther Superfund site is located in Clarksdale, Coahoma County, Mississippi (Figure 1). The site occupies approximately 6.5 acres off Normandy Avenue and Patton Street, on the south side of the city of Clarksdale. The facility is bordered on the west by East Tallahatchie Avenue, to the south by Springer International, to the north by Graeber Brothers, and to the east by Normandy Avenue. Presently, Coahoma Inc. still uses a portion of the facility as a warehouse.

The Red Panther Chemical facility began operations in 1949 as a pesticide production plant. The plant formulated liquid and powdered herbicides, insecticides, and fungicides, including toxaphene, aldrin, arsenic, and DDT. The facility reportedly did not manufacture any active ingredients, but only received technical materials from basic manufacturers. Previous owners of the facility include Coahoma Chemical Company, Riverside Chemical Company, and MFC Services.

The Red Panther facility filed a Resource Conservation and Recovery Act (RCRA) hazardous waste management activity notification and a Part A application in 1980 for storage of wastewater and spent or used solvents in drums and tanks onsite. Wastewater and solvents containing pesticide and solvent residues were generated from the cleaning of equipment. In November 1985, the facility obtained a RCRA Part B permit from the Mississippi Bureau of Pollution Control (MBPC) to store wastewater and spent solvents. At some point prior to obtaining RCRA interim status, and/or permit status, wastewater from the formulating process

was discharged either directly to an offsite ditch or into an underground septic tank and drain field on the facility property. MBPC completed a site inspection in 1984 (Potential Hazardous Waste Site Report, Clifford D. Porterfield) concluding that the sediment and soil samples contained detectable levels of chlorinated pesticides and arsenic.

In 1999, the EPA Superfund Technical Assessment and Response Team (START) conducted surface and subsurface sampling at the site. The sampling effort focused on the drainage ditches (Area A), the former onsite septic tank and drain field (Area B), and the railroad spur located behind the facility at the loading dock area (Area C) (Figure 2).

The AOC between EPA Region IV and the Performing PRPs was finalized in September 2001. The AOC contained the previously described four components, established the performance standards for the surface and subsurface soils, and provided a schedule for performing the Phase I Removal Action. The constituents of concern (COCs) for the Red Panther site include arsenic, toxaphene, dieldrin, and total chlorinated pesticides (for surface soils only).

In 2001, the Performing PRPs retained Newfields and URS to prepare a Phase I Removal Action Work Plan including a Sampling and Analysis Plan (SAP), Quality Assurance Project Plan (QAPP), Site Safety and Health Plan (SSHP) and to ascertain acceptable surface and subsurface soil performance standards prior to conducting the Phase I Removal Action at the facility. The Phase I Work Plan was submitted to EPA Region IV on May 24, 2002 and was subsequently approved.

Ditch soil characterization work was performed in June 2002 in accordance with the work plan. Soil samples were collected from six drainage ditches that border or are directly affected by runoff drainage from the site. Composite soil samples were collected from the 0-1 and 1-2 foot interval below the land surface (bls) and analyzed for total chlorinated pesticides and arsenic. In August 2002, a technical memo was prepared and submitted to EPA Region IV requesting several modifications to the Phase I Work Plan based on the results of the ditch characterization sampling. A copy of the technical memo is included in Appendix A. Specifically, the modifications involved addressing Ditches 5 and 6 under the Phase II Work Plan instead of Phase I, installing a security fence around Ditches 5 and 6 to prevent public access, and establishing eight soil sampling grids in ditches 5 and 6. EPA Region IV approved the modifications as part of the original work plan. In October 2002, a revised schedule was submitted to EPA to extend the due date of the Site Characterization report. EPA Region IV approved this request on October 30, 2002.

## 2.0 DITCH CHARACTERIZATION ACTIVITIES

Ditch characterization activities were performed from June 24, 2002 through June 27, 2002. The purpose of the ditch sampling was to compare the analytical results to the performance standards, estimate the amount of soil that would require excavation to meet the performance standards, and to evaluate disposal options for the soils to be excavated. Six ditches (designated 1 through 6) were sampled during the characterization activities (Figure 2).

Ditch 1 receives runoff from a portion of Area D where the liquid blending operation was reportedly performed (Figure 2). Ditch 1 also receives a substantial amount of roof runoff from the warehouses in Area D. Ditch 1 drains into Ditch 2 on the south side of Patton Street. Ditches 5 and 6 are located on the northern side of the facility and are the most upgradient ditches that receive runoff from the site. Surface water in Area B drains to the north into Ditches 5 and 6, which then flows southeastwards into Ditch 4, which then turns drains into Ditch 3 through a culvert under Normandy Avenue. Ditch 3 drains underneath Patton Street through two culverts into Ditch 2.

The ditch sampling was performed in accordance with the approved Sampling and Analysis Plan (SAP) and Quality Assurance Project Plan (QAPP). The soil samples were collected using stainless steel hand augers and sampling equipment. The sampling equipment was decontaminated between each sample location in accordance with the QAPP. The investigative derived waste (IDW) generated during the sampling effort was placed in 55-gallon Department of Transportation (DOT) drums, properly labeled, and secured onsite pending disposal during future removal actions. One drum of liquid decontamination fluids (wash and rinse water and isopropanol) and one drum of soil cuttings were generated during the ditch characterization.

A pair of composite soil samples were collected from each of the six ditches (Figure 3). Each pair consisted of a composite soil sample collected from the 0-1 foot below land surface (bls) interval and 1-2 foot bls interval in each ditch. A composite sample was formed by collecting soil from 5 aliquots (designated A through E) from the same interval (0-1' or 1-2') spaced evenly along the centerline of each ditch. Figure 3 shows the sample locations in each ditch. Each aliquot sample location was marked with a stake and surveyed for horizontal control by W.L. Burle, a registered surveyor in the State of Mississippi.

The ditch characterization samples were submitted to Test America, Inc. in Nashville, Tennessee for analysis of total chlorinated pesticides by EPA Method 8081A, arsenic by EPA Method 6010, and Toxicity Leaching Characteristic Procedure (TCLP) parameters (full list). The analytical results are presented on Table 1. A summary of the Quality Assurance Quality Control (QA/QC) samples is provided on Table 2. A copy of the analytical data and the chain-of-custodians are provided in Appendix B.

Table 3 presents the soil performance standards as outlined in the Phase I Work Plan and in the AOC. Surface soils are defined as the top two feet of soil. Subsurface soils are defined as the soils below the top two feet. The COCs for surface soils include total chlorinated pesticides, arsenic, dieldrin, and toxaphene; whereas, the COCs for the subsurface soils are arsenic, dieldrin, and toxaphene. The ditch characterization data indicated that the concentrations of total

chlorinated pesticides and dieldrin in the surface soils of Ditches 1 and 2 generally exceeded the performance standards; whereas, the concentrations of total chlorinated pesticides, dieldrin, and toxaphene in Ditches 3, 4, 5, and 6 surface soils did not exceed the performance standards. Arsenic was detected at lower concentrations in Ditches 1 and 2, and in higher concentrations detected in Ditches 3, 4, 5, and 6. The arsenic concentrations in all six ditches exceeded the performance standards.

The soils in Ditches 1, 2, 3, and 4 did not exceed the TCLP regulatory limits for the full TCLP parameter list except for the 0-1' foot interval in Ditch 4. Tetrachloroethene was detected at 0.87 milligrams per liter (mg/L) in the 0-1' foot interval in Ditch 4, which barely exceeded the TCLP regulatory limit of 0.7 mg/L. Based on the TCLP testing, a majority of the soils in Ditches 1, 2, 3, and 4 were classified as nonhazardous and could be disposed at a Subtitle D Landfill.

A majority of the soils in Ditches 5 and 6 exceeded the TCLP regulatory limit for arsenic (5.0 mg/L). Disposal of soils in Ditches 5 and 6 that exceed TCLP criteria for arsenic is subject to the hazardous waste and land disposal regulations.

Based upon the review of the analytical data, a request to modify the Phase I Work Plan was submitted to EPA on August 24, 2002. The modification included delaying the excavation of Ditches 5 and 6 until Phase II because the lateral and vertical extent of the impacted soils was unknown. A copy of the Phase I Work Plan modification request is included in Appendix A.

## 3.0 PHASE I REMOVAL ACTION

### 3.1 Purpose

The scope of work for the Phase I Removal Action was to excavate the surface soils from Ditches 1, 2, 3, and 4, perform confirmation sampling after the soils were removed, and to erect a security fence around Ditches 5 and 6 to prevent access to the ditches. The objective of the ditch soil removal action was to remove the surface and subsurface ditch soils exceeding the performance standards and to limit access to Ditches 5 and 6 until the impacted soils in these two ditches can be removed during Phase II.

### 3.2 Ditch Excavation Activities

The Phase I Removal Action was performed from November 11, 2002 through November 22, 2002. Prior to commencement of the removal activities, all appropriate permits were obtained from the City of Clarksdale and the Mississippi Department of Transportation (MS DOT) for excavation of the ditches. In addition to obtaining permits from the City, utilities were located and marked prior to the start of the excavation activities. URS retained HEPACO Incorporated in Memphis, Tennessee to perform the removal activities. Region IV EPA's contractor, Roy F. Weston, provided oversight services for EPA during the removal action.

Contamination Reduction Zones were established adjacent to Normandy Avenue, upgradient of Ditch 1, for the decontamination of excavation equipment during excavation activities. Prior to and after final completion of excavation activities, all excavation equipment was decontaminated using a high-pressure water wash. All decontamination wash waters were collected and stored onsite in 55-gallon drums or a 2,500-gallon frac tank, until disposal could be arranged.

The upper two feet of soil in Ditches 2 and 3 and the 0-1 foot interval in Ditch 1 were excavated and directly loaded into trucks for transportation to the Waste Management Subtitle D Landfill located in Robinson, Mississippi. The soils in these two ditches were determined to be nonhazardous during the ditch characterization sampling (see Table 1) and were profiled into the landfill prior to the start of the removal action. A copy of the waste disposal profile is included in Appendix C.

The soils in the 1-2 foot interval in Ditch 1 and the soils in Ditch 4 exceeded the TCLP regulatory limits for endrin (0.02 mg/L) and PCE (0.7 mg/L), respectively (Table 1). Therefore, it was determined that the 1-2 foot interval in Ditch 1 and soils in Ditch 4 would be stockpiled separately in the concrete berm in Area B. A composite sample was then collected from each of the stockpiles and submitted to Test America for TCLP testing. The resample of the Ditch 4 soils indicated these soils did not exceed the TCLP regulatory limit for PCE. Therefore, these soils were determined to be nonhazardous and could be disposed of at the Waste Management Subtitle D Landfill. The Ditch 1 soils that were resampled exceeded the TCLP toxaphene regulatory limit of 0.50 mg/L. These soils were stockpiled in the concrete berm in Area B for disposal during the Phase II Removal Action. The stockpile was placed on plastic sheeting and the entire stockpile covered and secured to prevent rainwater run-on and runoff. Table 4

provides the TCLP analytical results for the Ditch 1 and 4 stockpiles. A copy of the analytical data is included in Appendix D.

Once each ditch had been excavated to a 2 foot depth (except for Ditch 1), composite confirmation samples were collected. A composite sample was collected every 50 feet along the ditches (except where the culverts existed). The composite samples were formed by collecting soil from 5 aliquots (designated A1 through A5) spaced evenly along the centerline of the ditch. The samples were sent to Test America Laboratories in Nashville, Tennessee for analysis. The confirmation samples were analyzed for arsenic, dieldrin, and toxaphene (COCs for subsurface soils). The confirmation sample results are presented on Table 5. A copy of the analytical data is provided in Appendix E.

After the ditch confirmation sample data was received the 95% UCL of the mean concentration over the ditch exposure domain was calculated. It was found that Ditches 3 and 4 met the performance standards and were approved for backfill. The results of the 95% UCL calculation of the mean of the confirmation samples is provided in Appendix F. Portions of Ditches 1 and 2 still exceeded the performance standards and required additional soil removal. An additional 1-foot interval was excavated from these portions of Ditches 1 and 2. Confirmation samples (D1-C3 from Ditch 1 and D2-C5, D2-C6, and D2-C7 from Ditch 2) were collected from the bottom (3' bls) of both ditches after the additional 1-foot of soil was removed (Figure 5). The 95% UCL was recalculated and indicated that the ditch domain again failed the subsurface performance standards for toxaphene and dieldrin. The soils remaining in Ditches 1 and 2 that failed the subsurface performance standards will be addressed in the Phase II Work Plan. The statistical evaluation report (Memo, Newfields, December 6, 2002) is attached as Appendix F. The analytical results are presented on Table 5.

Approximately 900 tons of soil were excavated during the removal action from the four ditches. Of the soil excavated during this phase, 825 tons were disposed of at the Waste Management Subtitle D landfill. Table 6 lists the manifest numbers and tons of soil for each shipment that was transported to the landfill. The remaining 75 tons were comprised of the Ditch 1 soil that was stockpiled onsite and secured and will be addressed during Phase II, since these soils exceeded TCLP criteria.

### 3.3 Perimeter Air Monitoring During Removal Activities

Air monitoring was conducted at the perimeter of the exclusion zones during remediation activities that involved excavation, sorting, or direct handling of excavated soils. The purpose of monitoring was to monitor and control any potential off site migration of volatile substances or dusts. The monitoring strategy included the following:

- Real time monitoring for total organic vapors and particulates at the exclusion zone such that timely decisions could be made as needed to modify remedial operations or procedures, or to modify the level of personnel protection equipment required for worker protection.
- Dust measurements were collected using a real-time dust monitor for evaluation of potential off site impact from particulate matter.

### 3.3.1 Volatile Chemical Real Time Monitoring

Volatile emissions onsite were monitored utilizing direct read instrumentation. A photoionization detector (PID) was used to measure concentrations of organic vapors periodically at the site fence line, at the exclusion zone boundary, in the breathing zone, and in the excavated soils. Values obtained from the PID are listed on Table 7.

No exceedances of the 5 ppm breathing zone standard were observed in the breathing zone, at the exclusion zone boundary, or the site fence line.

### 3.3.2 Dust Monitoring

Fugitive dust monitoring was performed around the perimeter of the site during periods of active remediation activities. Portable instruments were used to collect dust measurements at two-hour intervals, upwind and downwind of the waste handling activities. Dust collection was performed using a GCE Mini-Ram portable dust monitor. In operation, ambient air is drawn by an internal pump and passed through a light beam where refracted dust is detected and digitally expressed in milligrams per cubic meter ( $\text{mg}/\text{m}^3$ ). The monitor is calibrated with clean air prior to sampling to establish the zero level. Readings were recorded on a standard form noting the date, time, and location of sample reading. The continuous monitors were calibrated or zeroed daily with a certified gas standard or per the manufacturers instructions to ensure that precise measurements were made.

No fugitive dust levels monitored downwind of the activity were  $5 \text{ mg}/\text{m}^3$  greater than the upwind readings. Therefore, per the SSHP, no action was required to mitigate dust emissions during the removal action.

## 3.4 Culvert Removal and Replacement

Approximately 24 linear feet of 12-inch diameter and 365 linear feet of 16-inch diameter shallow metal corrugated culverts along Normandy Avenue and 22 linear feet of 18-inch diameter and 97 linear feet of 24-inch diameter concrete culvert along Patton Street were removed and replaced with new culverts. Removed metal culverts were crushed and disposed with the nonhazardous materials at the approved Tunica Subtitle D Landfill. Removed concrete culverts were transported and disposed of intact. Culverts were replaced in their former locations using similar concrete or galvanized steel culverts. Following installation culvert soils and gravel beds were compacted with a vibrating compactor. The culverts were surveyed during installation to ensure appropriate drainage.

## 3.5 Ditch Restoration

A local borrow pit was utilized as a source of backfill for the ditch restoration. Prior to utilization, one composite sample was collected from the borrow pit and analyzed for Target Analyte List (TAL) metals and cyanide and Target Compound List (TCL) organics using EPA methods. The backfill sample contained low level of arsenic (4.92 mg/kg), considered to be

within the range of background levels in the area. It also contained 0.008 mg/kg DDT. Table 8 summarizes the borrow material analytical results and a copy of the analytical data is included in Appendix H. The borrow pit was approved by EPA after review of the analytical data.

The ditches were backfilled with soil from the borrow pit and were compacted using the excavator bucket and by running the excavator or the dozer over each area. Orange high visibility fencing was placed in the bottom of each ditch prior to backfilling to delineate clean fill from undisturbed soils, should additional excavation be required in the future. The ditches were surveyed during the backfilling operation to ensure that grade was maintained and the ditches would drain properly.

After the ditches were backfilled and graded, erosion and sedimentation control measures were installed. Erosion control measures consisted of lining the bottom and slopes of the ditches with grass matting. In addition, a series of hay bales were installed in Ditch 2, near Highway 49, to prevent silt from leaving the site. Ditches 5 and 6, which were not excavated, were also lined with the grass matting. A series of hay bales with silt fence were also installed in Ditches 5 and 6 every 100 feet to minimize sediment erosion and transport to the downgradient Ditches 1, 2, 3, and 4.

### 3.6 Surface Water Containment and Disposal

Heavy rains filled the ditches (mainly 1, 2, 3, and 4) several times during the backfilling process, complicating the excavation and backfilling process. A sample of the storm water was collected on November 20, 2002 and was analyzed for arsenic, dieldrin, and toxaphene. The analysis indicated the storm water contained 3.6 ug/L of arsenic, 1.2 ug/L of dieldrin, and was below the laboratory detection limits for toxaphene. The analytical results are presented on Table 9. Since the bottom of Ditches 1 and 2 failed the excavation standards and the storm water sample indicated that the storm water had been impacted, EPA directed that the storm water not be discharged directly downgradient from the ditches or to the sanitary sewer. The storm water was pumped out of the ditches and held on-site until disposal options could be determined.

A 20,000-gallon frac tank and a 2,500-gallon poly tank were brought on site to temporarily store the storm water. Approximately 23,000 gallons of water was eventually pumped from the ditches and collected on-site. A sample of the tank contents were collected on November 25, 2002 and submitted to Analytical Services, Inc. in Norcross, Georgia for analysis. The analytical data is presented on Table 9 and a copy of the data is included in Appendix I. The storm water in the holding tanks contained concentrations of pesticides that were above the levels that the local POTW would accept. The storm water was subsequently profiled for disposal as a non-hazardous non-regulated liquid at Excel TSD, Inc. in Memphis. On December 10, 2002 the 22,604 gallons of storm water were shipped to Excel TSD, Inc. for final treatment and disposal. Copies of the waste manifest are included in Appendix J.

### 3.7 Site Access and Security

During the removal action, approximately 350 feet of 6-foot high chain-link fence was removed from the north end of the property along Ditches 5 and 6 and disposed offsite. After the removal action was complete, a new 6-foot high chain-link fence, with three-strand barbed wire, was

installed north of Ditches 5 and 6 to prevent public access. A gate and lock was installed at the southeastern end of Ditch 5 to allow access to perform future removal action activities, as necessary.

## **4.0 RECOMMENDATIONS**

Based upon the results of the Phase I Removal Action, URS makes the following recommendations:

- Address the soils remaining in Ditches 1 and 2 in the Phase II Work Plan.
- Address disposal options for the stockpiled soils from Ditch 1 in the Phase II Work Plan. The Ditch 1 soils currently stockpiled in the Area B berm should be periodically (i. e. every 3 months) inspected to ensure that the stockpile is properly covered.

Re: Submittal of Data and Modifications to Phase I Work Plan Ditch Excavation and Site Characterization  
Red Panther Pesticide Superfund Site, Clarksdale, Mississippi  
Administrative Order on Consent for Removal Action  
Docket No. CER-04-2001-3766

Dear Ms Jones:

The purpose of this letter is 1) to transmit the field sampling results from the ditch characterization samples taken at the Red Panther Pesticide Superfund site (the "Site") in June; 2) based on these results and the field observations, request a modification to the ditch excavation and site characterization sampling as described below; and 3) seek written approval of the Final Work Plan, as modified.

**Modification #1 – Excavate ditches 1, 2, 3 and 4 during Phase I activities; address ditches 5 and 6 during Phase II removal work**

*Ditches 1, 2, 3 and 4 are materially different from ditches 5 and 6*

The soil sample results and field observations indicate that there are two separate types of surface soil materials in the ditches that are to be excavated. The material in ditches 1, 2, 3 and 4 contain primarily pesticides. Some arsenic is also present in ditches 3 and 4. The material in ditches 5 and 6 contain arsenic and tetrachloroethene. The field samples also identified a visually distinct possible "product-like" material in two of the borings in ditch 6. The lateral extent of this material is not known since the samples were collected only along the centerline of the ditch.

*Avoid risking large excavation off-site during ditch excavation*

We propose to defer excavation of ditches 5 and 6 to avoid opening a potentially large excavation during the ditch removal operation, in an area off the Red Panther property.

*Coordinate ditch 5 and 6 excavation with future work after further sampling.*

We propose to defer excavation of ditches 5 and 6 to allow additional sampling of these ditches to be performed during site characterization sampling. Horizontal and

vertical excavation cut lines for ditches 5 and 6 can then be developed and the excavation can be coordinated with the removal work performed with respect to the remainder of the site.

*Disposal requirements differ*

The TCLP results of ditch 5 and 6 samples are characteristically hazardous for arsenic and tetrachloroethene. The results from ditches 1, 2, 3 and 4 were not characteristically hazardous with the exception of a slight exceedance in ditch 4 for tetrachloroethene. (Ditch 4 will be resampled for characterization following excavation and prior to disposal.) Ditches 5 and 6 may require segregation of the excavated soils for proper disposal. Deferring the excavation of the soils from ditches 5 and 6 until the removal activities during Phase II would allow more efficient handling by consolidation with other hazardous materials requiring similar treatment. Assuming the resample of ditch 4 proves non-hazardous, the soils from ditches 1, 2, 3 and 4 will be non-hazardous and can be disposed off-site in a sub-title D landfill. If the resample of ditch 4 indicates TCLP exceedances, the appropriate soils from ditch 4 will be covered and stockpiled on site.

*Source of tetrachloroethene unknown*

Please note that the PRP group will perform the remediation required to properly dispose of the soils in the ditches contaminated with tetrachloroethene, and as noted above, horizontal and vertical excavation cut lines for ditches 5 and 6 will be developed so that the excavation can be coordinated with the removal activities on the remainder of the site, utilizing the constituents of concern in the Administrative Order on Consent (AOC) to determine the extent of removal. However, the AOC otherwise does not address tetrachloroethene, and it was not identified as a constituent of concern on the site proper through EPA's extensive sampling on the Red Panther property. The ditches where it has been identified receive runoff from other potential source locations not associated with the Site. The PRP group does not accept responsibility for placing the tetrachloroethene in the ditches. The PRP group has no knowledge of records that indicate tetrachloroethene was used at the Red Panther facility. The PRP group assumes it has no further responsibility for investigation or remediation of tetrachloroethene and does not anticipate conducting work specific to the substance beyond the excavation necessary to reach the performance standards specified in the AOC.

**Modification #2 – Install fence and erosion control along ditches 5 and 6**

The PRP group will install a fence north of the ditch on the Graeber property. The fence will limit access to the ditches in the interim period from the ditch excavation through completion of site remediation. During the excavation of ditches 1 through 4 the group will also install silt fences and hay bales along ditches 5 and 6 in order to reduce erosion and runoff.

**Modification #3 – Add sample grids to ditches 5 and 6**

The attached figures show the modified surface and subsurface exposure domain and the proposed additional sample grids for ditches 5 and 6. The original exposure domain included the area of ditch 5 and the parking area immediately to the northeast. Ditch 6 was not included in the original exposure domain. An area approximately 20 feet wide and 200 feet long was added to the north side of Area B to bring in ditch 6 (Figure 1). Figure 2 shows the additional sampling grids to be added to the site characterization sampling plan for ditches 5 and 6. These grids are numbered BG13 through BG20. The ditch sampling grids will be sampled in the same manner and for the same constituents as the on site grids for the site characterization.

**Modification #4 – Remove and replace road and driveway culverts instead of pressure washing**

The culverts had previously been planned for pressure washing with collection of sediments and wash water. The culverts were to remain in place following the ditch excavation. Given the poor condition of the culverts and complexity of collecting the sediments and wash water, the group will instead excavate the culvert across the roadways, driveways and ditches in the areas of ditches 1, 2, 3 and 4 and replace with new corrugated metal culverts. Material excavated will be disposed with the other ditch materials in the sub-title D landfill. The metal culverts removed will be crushed and disposed in the sub-title D landfill.

Please be advised that to date we have not received written approval from U.S. EPA of the final Phase I Work Plan as provided under Section V(2)(A)(1)(d) of the AOC. The PRP group received an email approval of the draft Phase I Work Plan in March, and then submitted the Final Work Plan as required under Section V(2)(A)(1) of the AOC on May 24, 2002. As the Final Work Plan included elements that were not present in the draft Work Plan, and in light of the modifications requested in this letter, the PRP group requests U.S. EPA provide written approval of the Final Phase I Work Plan, as modified by this letter so that the implementation of the Phase I Work Plan field work can commence. Following receipt of written approval, the PRP group will submit a revised schedule for the Phase I Work Plan implementation.

Thank you for your attention in reviewing this modification to the Red Panther work plans.  
Please contact the undersigned if you have any questions or comments.

Sincerely,

URS

Re: Approval of August 24, 2002 Modifications to Phase I Final Work Plan  
Red Panther Site  
Clarksdale, Mississippi

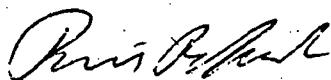

Dear Ms. Jones:

This letter is to acknowledge the Red Panther PRP's receipt of your approval letter for the modifications (dated August 24, 2002) to the Phase I Final Work Plan. The modifications will be incorporated as an appendix to the Final Work Plan. It is my understanding from our telephone conversation on September 11, 2002 that the PRPs do not need to reissue the Phase I Final Work Plan after incorporating the modifications. I will forward you a schedule for the ditch excavation and site characterization activities next week.

Re: Revised Schedule for Red Panther Site and Notification of Removal Start Date  
Red Panther Site  
Clarksdale, Mississippi

Dear Ms. Jones

This letter transmits a revised schedule for the Red Panther site activities. URS is requesting a 45-day extension on behalf of the PRPs for the submittal of the Site Characterization report with the revised submittal date of March 19, 2003. The extension is being requested due to the recent modifications to the Phase I Work Plan that were approved by EPA on September 11, 2002. This extension will give the PRPs, URS, and Newfields sufficient time to receive and review the large amount of data that will be generated during the site characterization.

This letter also serves to notify EPA that URS will begin the Red Panther Removal, specifically the excavation of ditches 1 through 4 on November 11, 2002, subject to confirmation of access to the Red Panther property and adjacent properties. The removal activities will take approximately two weeks to complete. The site characterization activities will begin on December 2, 2002 after the removal activities have been completed and last approximately three weeks.

Trichlorofluoromethane	ND	mg/l	0.00200	1	7/7/02	9:46	B.Werford	8260B	9191

Surrogate	Recovery	Target Range
VOA Surr 1,2-DCA-d4	90.	73. - 132.
VOA Surr Toluene-ds	93.	80. - 121.
VOA Surr, 4-EPR	97.	80. - 120.
VOA Surr, DBPM	90.	81. - 121.

### LABORATORY COMMENTS:

ND = Not detected at the report limit.

S = Analyte was detected in the method blank.

J = Estimated value below Report Limit.

E = Estimated Value above the calibration limit of the instrument.

# = Recovery outside Laboratory historical or method prescribed limits.

End of Sample Report.

Analyte	Result	Units	Report Limit	Dil Factor	Date	Time	Analyst	Method	Batch
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

### \*GENERAL CHEMISTRY PARAMETERS\*

# Dry Weight 81.9 6/26/02 14:00 X. Keller CLP 9179

### Sample Extraction Data

Parameter	Extracted	Extract Vol	Date	Time	Analyst	Method
OC Peat	30.0 gm	10.0 ml	7/ 9/02		M. Ricks	3650

### LABORATORY COMMENTS:

- ND - Not detected at the report limit.
- D - Analyte was detected in the method blank.
- E - Estimated Value below Report Limit.
- F - Estimated Value above the calibration limit of the instrument.
- G - Recovery outside laboratory historical or method prescribed limits.
- All reported results for metals or organic analyses have been corrected for dry weight.
- Peat surrogate diluted out due to sample matrix.

End of Sample Report.

- G - Recovery outside Laboratory historical or method prescribed limits.
- All reported results for metals or organic analyses have been corrected for dry weight.
- Pest surrogate diluted out-due to sample matrix. Endrin aldehyde result shows >40% difference between channels.

End of Sample Report.

Surrogate	% Recovery	Target Range
BNA Surr-2-Fluorobiphenyl	66.	42. - 113.
BNA Surr-Terphenyl-d14	78.	41. - 129.
BNA Surr-Phenol-d5	32.	1. - 75.
BNA Surr-2-Fluorophenol	48.	3. - 97.
BNA Surr-2,4,6-Tribromophenol	80.	38. - 174.
pest Surr-TCMX	36.	33. - 127.
surr-Dibutylchloroendate	38.	1. - 151.
surr-DCAA	90.	61. - 159.

### LABORATORY COMMENTS:

ND = Not detected at the report limit.

B = Analyte was detected in the method blank.

J = Estimated Value below Report Limit.

E = Estimated Value above the calibration limit of the instrument.

S = Recovery outside Laboratory historical or method prescribed limits.

End of Sample Report.

## ANALYTICAL REPORT

Laboratory Number: 02-A105538  
Sample ID: SB06 0-1  
Project:  
Page 3

Surrogate	% Recovery	Target Range
BMA Surr-2-Fluorobiphenyl	68.	42. - 113.
BMA Surr-Terphenyl-d14	78.	41. - 129.
BMA Surr-Phenol-d5	34.	1. - 75.
BMA Surr-2-Fluorophenol	48.	3. - 97.
BMA Surr-2,4,6-Tribromophenol	80.	36. - 174.
pest-Surr-TCMX	42.	33. - 127.
surr-Dibutylchloroendate	46.	1. - 151.
surr-DCAA	119.	61. - 159.

### LABORATORY COMMENTS:

ND = Not detected at the report limit.

B = Analyte was detected in the method blank.

J = Estimated Value below Report Limit.

E = Estimated Value above the calibration limit of the instrument.

O = Recovery outside Laboratory historical or method prescribed limits.

End of Sample Report.

Profile Number: WM

CU 4849

Renewal Date:

02/28/03

## A. Waste Generator Information

1. Generator Name: Red Panther PRP Group
2. Facility Street Address: 550 Python Street
3. Facility City: Lakewood
4. Zip/Postal Code: 38615
5. County: Co. of Alabama
6. Customer Name: HEPA 60
7. Customer Contact: Dawn Moore
8. Billing Address: 4020 N Watkins Avenue TN

2. SIC Code: \_\_\_\_\_
4. Phone: \_\_\_\_\_
6. State/Province: Mississippi
8. Generator USEPA/Federal ID #: 0A
10. State/Province ID #: \_\_\_\_\_
12. Customer Phone: (901) 345 6222
14. Customer Fax: 901 353 5932

## B. Waste Stream Information

## 7. Description

- a. Name of Waste: Cateredated Soil with Seabed
- b. Process Generating Waste: Research from pesticide facility

c. Color <u>Brown to Grey Black</u>	d. Strong odor (describe): <u>Mild earthy odor</u>	e. Physical state @ 70°F <input checked="" type="checkbox"/> Solid <input type="checkbox"/> Liquid <input type="checkbox"/> Gas <input type="checkbox"/> Sludge <input type="checkbox"/> Other _____	f. Layers <input checked="" type="checkbox"/> Single Layer <input type="checkbox"/> Multi-Layer	g. Free liquid range to %
				h. pH Range 5 to 7 %

i. Liquid Flash Point:  <73°F  73-99°F  100-189°F  140-189°F  > 200°F  Not applicable

j. Chemical Composition (list all constituents (including halogenated organics, boron, and UHCS) present in any concentration and submit representative test results):

Constituents	Concentration Range	Constituents	Concentration Range
<u>Soil</u>	<u>74 - 99%</u>		
<u>Debris (concrete, broken asbestos, metal, automobile vehicles)</u>	<u>35%</u>	<u>Asbestos</u>	
<u>Pesticides</u>			

(TOTAL COMPOSITION MUST EQUAL OR EXCEED 100%)

- k.  Oxidizer  Pyrophoric  Explosive  Radioactive  
 Corrosive  Infectious  Shock Sensitive  Water Reactive
- l. Does the waste represented by this profile contain any of the carcinogens which require OSHA notification? (list in Section B.1.j) \_\_\_\_\_
- m. Does the waste represented by this profile contain dioxins? (list in Section B.1.j) \_\_\_\_\_
- n. Does the waste represented by this profile contain asbestos? \_\_\_\_\_  
If yes, concentration \_\_\_\_\_ ppm
- o. Does the waste represented by this profile contain benzene?  
If yes, concentration \_\_\_\_\_ ppm  
Is the waste subject to the benzene waste operations NEI/SLAP? \_\_\_\_\_
- p. Is the waste subject to HCRA Superfund CC controls?  
If no, does the waste meet the organic DDT exemption?  
If no, does the waste contain 500 ppm or more volatile organic (VO)?  
Volatile organic concentration \_\_\_\_\_ ppm
- q. Does the waste contain any Class I or Class II ozone-depleting substances?
- r. Does the waste contain debris? (list in Section B.1.j) \_\_\_\_\_
- s. Quantity of Waste  
Estimated Annual Volume 4000 \_\_\_\_\_  Tons  Yards  Drums  Other (specify) \_\_\_\_\_
- t. Shipping Information
  - a. Packaging:  
 Bulk Solid; Type/Size: End Uses on Re-Holls  Bulk Liquid; Type/Size: \_\_\_\_\_

- d. Reportable Quantity (lbs.; kgs.): N/A e. Hazard Class/ID #: \_\_\_\_\_
- f. USDOT Shipping Name: \_\_\_\_\_
- g. Personal Protective Equipment Requirements: Level "D"
- h. Transportor/Transfer Station: HEPACO

## C. Generator's Certification: (Please check appropriate responses, sign, and date below.)

1. Is this a USEPA hazardous waste (40 CFR Part 261)? If the answer is no, skip to 2.  YES  NO
- a. If yes, identify ALL USEPA listed and non-listed waste codes numbers (D, F, K, P, U) \_\_\_\_\_
- b. If a characteristic hazardous waste, do underlying hazardous constituents (UICs) apply? (If yes, list in Section B.1.)  YES  NO
- c. Does this waste contain asbestos? (If yes, list size and type in Chemical Composition - B.1.)  YES  NO
2. Is this a state hazardous waste? Identify ALL state hazardous waste codes  YES  NO
3. Is the waste from a CERCLA (40 CFR 300, Appendix B) or state mandated clean-up? If yes, attach Record of Decision (ROD), 104/106 or 122 order or court order that governs site cleanup activity. For state mandated clean-up, provide relevant documentation.  YES  NO
4. Does the waste represented by this waste profile sheet not contain radioactive material, or is dispensed regulated by the Nuclear Regulatory Commission?  YES  NO
5. Does the waste represented by this waste profile sheet contain concentrations of Polychlorinated Biphenyls (PCBs) regulated by 40 CFR 761? (If yes, list in Chemical Composition - B.1.)  
a. If yes, were the PCBs imported into the U.S.?  YES  NO
6. Do the waste profile sheet and all attachments contain true and accurate descriptions of the waste products, and has all relevant information within the possession of the Generator regarding known or suspected hazards pertaining to the waste been disclosed to the Contractor?  YES  NO
7. Will all changes which occur in the character of the waste be identified by the Generator and disclosed to the Contractor prior to providing the waste to the Contractor?  YES  NO

(Check here if a Certificate of Destruction or Disposal is required.)

Any sample submitted is representative as defined in 40 CFR 261.1. Appendix I or by using an equivalent method, I authorize WM to obtain a sample from any waste shipment for purposes of characterization. If this certification is made by a broker, the undersigned signs as authorized agent of the generator and has confirmed the information contained in this Profile Sheet from information provided by the generator and additional information as it may determine to be reasonably necessary. If approved for management, Contractor has all the necessary permits and licenses for the waste that has been characterized and identified by this approved profile.

This report includes the analytical certificates of analysis for all samples listed below. These samples relate to your project 37778-010-1003 RED PANTHER. The Laboratory Project number is 309365.

An executed copy of the chain of custody, the project quality control data, and the sample receipt form are also included as an addendum to this report.

Sample Identification	Lab Number	Collection Date
D1-1-2	02-A187919	11/14/02
D4-0-2	02-A187920	11/14/02

Page 1

A2LA certification number 0453.07 for analysis of wastewater and solid/hazardous waste effective 09/30/99-12/31/03.

NELAC/Florida certification number E87358 for analysis of environmental water, soil/hazardous waste, and drinking water effective 07/01/99-06/30/03.

These results relate only to the items tested.  
This report shall not be reproduced except in full and with permission of the laboratory.

This report includes the analytical certificates of analysis for all samples listed below. These samples relate to your project 37778-010-1003 R&D PANTHER. The Laboratory Project number is 309826.

An executed copy of the chain of custody, the project quality control data, and the sample receipt form are also included as an addendum to this report.

Page 1

Sample Identification ----- Lab Number ----- Collection Date -----

D3-C3 02-A190135 11/18/02

A2LA certification number 0453.07 for analysis of wastewater and solid/hazardous waste effective 09/30/99-12/31/03.

NELAC/Florida certification number E87358 for analysis of environmental water, soil/hazardous waste, and drinking water effective 07/01/99-06/30/03.

These results relate only to the items tested.  
This report shall not be reproduced except in full and with permission of the laboratory.

This report includes the analytical certificates of analysis for all samples listed below. These samples relate to your project 17778-010-1008 RED PANTHER. The Laboratory Project number is 310714.

An executed copy of the chain of custody, the project quality control data, and the sample receipt form are also included as an addendum to this report.

Sample Identification	Lab Number	Collection Date
D1-C3	02-A194149	11/22/02
D2-C5	02-A194150	11/22/02
D2-C6	02-A194151	11/22/02
D2-C7	02-A194152	11/22/02

A2LA certification number 0453.07 for analysis of wastewater and solid/hazardous waste effective 09/30/99-12/31/03.

NELAC/Florida certification number E87358 for analysis of environmental water, soil/hazardous waste, and drinking water effective 07/01/99-06/30/03.

These results relate only to the items tested.  
This report shall not be reproduced except in full and with permission of the laboratory.

Re: Ditch Confirmation Samples  
Site Characterization Grids  
Sample QA/QC review

**Current Ditch Confirmation Samples**

Second round confirmation sample results have been obtained from the area of 1 foot of additional excavation in ditch areas D1-1, D2-1, D2-3 and D2-4. The second statistical run with the second results replacing the results in the first round indicates that the ditch domain fails the subsurface performance standards for toxaphene and dieldrin. The subsurface standard for arsenic passes. Therefore, the ditch domain will have to be addressed in the Phase II Work Plan. The table below shows the current results for the ditch domain.

A	B	C	D	E	F	G
1						
2	95% UCL of Mean >		109.9	805.1	36.7	
3	# Blocks Sampled w/ results >		12	12	12	
4	Excavated Values Mean ->		77.4	345.8	16.3	
5	Performance Standard Value->		270	220	15	
6	Student's T		1.8	1.8	1.8	

Grid #	Status	Arsenic	Toxaphene	Dieldrin	Backfill Status
1 D1-1 (D1-c3)	Sampled	14.5	3130.0	140.0	
2 D1-2	Sampled	47.3	243.0	9.8	
3 D2-1 (D2-c5)	Sampled	26.8	157.0	13.3	
4 D2-2	Sampled	119.0	209.0	19.0

- 21  
22 Notes:  
23 Grids highlighted (D1-1, D2-2, D2-3, D2-4) were excavated additional 1 foot  
24 Grid numbers in parenthesis are second round results

**NEWFIELDS**

1965 Lakemont Drive, Birmingham AL 35244  
Phone 205-428-8388, fax 205-426-0694

### **Area B Site Characterization Grids**

After more careful inspection of the concrete in area B, NewFields recommends that the grids in the tank farm be sampled as originally called for in the work plan. The concrete containment found in the tank farm area covered by grids BG-1 and BG-4 is in very poor condition with several large cracks and holes. In addition, a large portion of the concrete in the NE corner has been pulled back completely. In contrast, the tank farm in area D, which is not being sampled, is in very good condition. The logic is sound for sampling the containment in poor condition and not sampling the containment in good condition. Therefore in order to avoid future questions about this area, grids BG-1 and BG-4 should be sampled at this time as originally planned.

Concrete slabs in area B have been found. NewFields recommends that these concrete slabs be cored through and the soil samples be collected as planned.

**NEWFIELDS**

1965 Lakemont Drive, Birmingham AL 35244  
Phone 205-428-8388, fax 205-426-0694

### Area D Site Characterization Grids

As previously discussed, two additional grids have been added to Area D. The two grids cover the area of exposed soils in the NW corner of the area adjacent to the buildings. The subsurface samples approximate locations are shown below. The 5 aliquots for the surface samples should be collected from random locations within each grid. As with the other grids, coordinates for the actual sample location will be obtained by the surveyor following sample collection. The new grids, D-10 and D-11 are shown in the figure below.

Concrete slabs have also been found in Area D. NewFields recommends that these concrete slabs be cored through and the soil samples be collected as planned.

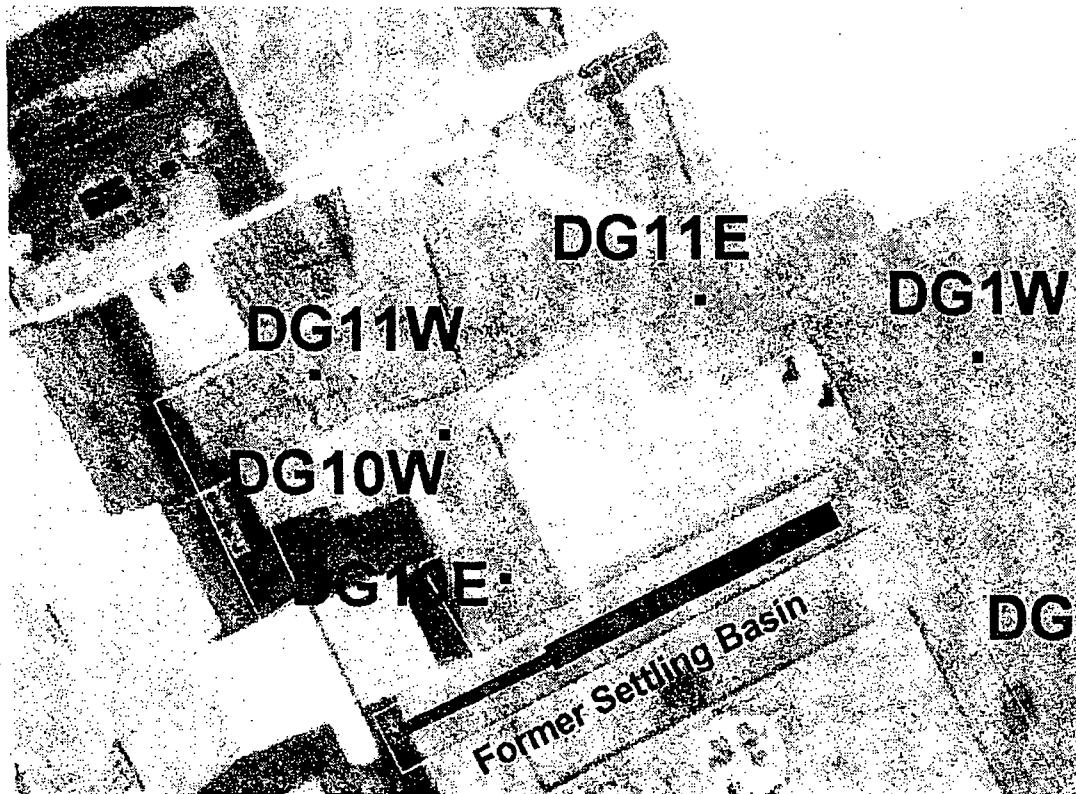

### QA/QC Samples

The Work Plan calls for level III data packages from the lab with 10 percent of the samples at level IV. Please be sure to have 10 percent of the samples processed with level IV data packages.

(662) 363-0170 Fax

## Certificate of Disposal

Red Panther Chemical  
WMI Profile Number CU4849

Be It Known By All Men,

Beginning on November 11, 2002, through December 27, 2002, 33 loads containing 854.16 tons of non-regulated solids from Red Panther 550 Patton Road in Clarksdale, Mississippi were transported by Matthews Trucking under the direction of Hepaco, Inc. 4000 North Watkins Memphis, Tennessee to Waste Management of Tunica Landfill Inc.

These loads were deposited on the landfill; the exact location determined by an agent of the landfill owner and equipment operator. Each load was placed within the confines of approved Sub-titled D Lined Area for final internment, properly destroying the entire shipment.

As previously mentioned this project to date has consisted of destruction of 33 loads and an Online Report substantiating this fact is enclosed.

I, Jeffrey H. Papasan, agent for Waste Management of Tunica Landfill Inc., certify that said destruction did occur at this facility located at 6035 Bowdre Road in Robinsonville, Mississippi.

If you should have any questions in regard to this matter please feel free to contact me at 662-363-2282.

Respectfully Submitted,

  
Jeffrey H. Papasan  
District Manager  
Waste Management of Tunica Landfill Inc

## ANALYTICAL REPORT

Laboratory Number: 02-A186013  
Sample ID: SBP-01  
Project:  
Page 4

---

### Sample Extraction Data

Parameter	Extracted	Extract Vol	Date	Time	Analyst	Method
OC Pest	29.9 gm	10.0 ml	11/13/02		M. Lax	3550
Volatile Organics	8.0 g	5.0 ml	11/12/02	8:40	K. Turner	5035

---

Surrogate	% Recovery	Target Range
VOA Surr 1,2-DCA-d4	110.	56. - 155.
VOA Surr Toluene-d8	98.	79. - 130.
VOA Surr, 4-BFB	101.	62. - 155.
VOA Surr, DBFM	103.	74. - 127.
pest surr-TCMX	92.	48. - 132.
pest surr-DCB	88.	46. - 140.

### LABORATORY COMMENTS:

ND = Not detected at the report limit.

B = Analyte was detected in the method blank.

J = Estimated Value below Report Limit.

E = Estimated Value above the calibration limit of the instrument.

# = Recovery outside Laboratory historical or method prescribed limits.

All results reported on a wet weight basis.

End of Sample Report.

## **Definitions of Terms**

- B** - Found in Laboratory Blank
- BDL** - Below Detection Limit
- C** - Co-eluting Isomer Present
- E** - Estimated Concentration
- F** - Positively Identified Below the Reporting Limit
- H** - Results Within Limits, See Attached
- J** - Estimated Concentration
- M** - A Matrix Effect was Determined to be Present in the Sample
- ND** - None Detected
- R** - The Data is Unusable Due to the Inability to Analyze the Sample  
and Meet the Quality Control Criteria
- TIC** - Tentatively Identified Compound
- U** - Not Detected at the Level Reported
- CFU** - Colony Forming Units

**NOTE: Unless otherwise noted, all results are reported on an as received basis.**

## Laboratory Report

Report Number 167175

Project: Red Panther Clarksdale MS, Project#37778-010

Prepared For:  
URS - Atlanta  
235 Peachtree Street, N.E.  
North Tower, Suite 2000  
Atlanta, GA 30303

Attention: Mr. Brent Jacobs

December 6, 2002

P.O. No. 37778-010

We appreciate the opportunity to provide the analytical support for your project. The analytical results in this report are based upon information supplied by you, the client, and are for your exclusive use. If you have any questions regarding this data package, please do not hesitate to call.

Sue Barto

Project Manager

Christina Harbrook

## Definitions of Terms

- B** - Found in Laboratory Blank
- BDL** - Below Detection Limit
- C** - Co-eluting Isomer Present
- E** - Estimated Concentration
- F** - Positively Identified Below the Reporting Limit
- H** - Results Within Limits, See Attached
- J** - Estimated Concentration
- M** - A Matrix Effect was Determined to be Present in the Sample
- ND** - None Detected
- R** - The Data is Unusable Due to the Inability to Analyze the Sample  
and Meet the Quality Control Criteria
- TIC** - Tentatively Identified Compound
- U** - Not Detected at the Level Reported
- CFU** - Colony Forming Units

**NOTE:** Unless otherwise noted, all results are reported on an as received basis.

Analytical Services Inc., Norcross Laboratory maintains the following certifications, approvals, and accreditations:  
Georgia (S12); NELAC (E87315) scope: CWA, SDWA, RCRA expires June 30, 2003; Arkansas; California (01160 CA); Connecticut (PH-0250); Florida (E87315);  
Kansas (E-10334); Kentucky (90126); Louisiana (02069); New Jersey (GA001); New York (11762); North Carolina (381); Oklahoma (9907); South Carolina  
(98011); Tennessee (02994); USDA Soil Import License (S-36027). For more information visit our website at: [asi-lab.com](http://asi-lab.com)

## EXECUTIVE SUMMARY

This report presents the results of the Phase II Final Design Sampling activities conducted in June 2004 at the Red Panther Superfund Site in Clarksdale, Mississippi. The Final Design Sampling activities were performed from June 28, 2004 to June 29, 2004. The Final Design Sampling was conducted to collect composite soil samples from the 2-6' below land surface (bls) intervals and 6-10' bls intervals that require excavation. The purpose of the sampling was to determine the appropriate disposal methodology for the soils in Area B during the Phase II Removal. Additional sampling was also performed during the sampling event to evaluate surface soils in two drainage ditches bordering the site, the breezeway area in Area D, and the contents of a silo in Area D. The Final Design Sampling was done in accordance with the schedule established at the June 2, 2004 meeting with EPA held at the Red Panther site.

A total of 7 composite soil samples were collected from Area B for TCLP and volatile organic compounds (VOCs), semivolatile organic (SVOCs), and RCRA metals testing to determine the appropriate disposal methodology for the Phase II Removal (Figure 2). The locations of the TCLP samples were based on the final excavation cutlines provided by Newfields. The TCLP analytical results were compared to the regulatory limits to evaluate which soils may be designated a characteristic hazardous waste if excavated. The analytical results are presented on Table 1 and shown on Figure 2. The analytical results indicate that 5 of the 7 samples (AB TCLP 14 2-6', AB TCLP 14 6-10', AB TCLP 15 2-6', AB TCLP 16 2-6', and AB TCLP 17 6-10') exceeded the TCLP regulatory limits for arsenic.

Additional sampling was performed during the Final Design Sampling event to evaluate surface soils in other areas of the site and to evaluate the contents of a silo in Area D. Two drainage ditches, one east of Normandy Avenue and one bordering the southern side of the site (former Sasse Street) were sampled to evaluate if the soils in the drainage ditches exceeded the surface soil performance standards. Two Direct Push Technology (DPTs) borings were installed in each ditch (Figure 3) to collect soil samples for the evaluation. Samples were collected from the 0-1' and 1-2' bls intervals in each ditch. The samples were analyzed for the surface soil constituents of concern (COCs) arsenic by EPA Method 6010 and dieldrin, toxaphene, and total chlorinated pesticides by EPA Method 8081A. The analytical results are presented on Table 2 and shown on Figure 3.

Samples were also collected from the breezeway area and the contents of the silo in Area D. The breezeway is an open area underneath the raised floor of one of the buildings in Area D. Two composite surface soil samples (0-1' bls) were collected from the breezeway and analyzed for the surface soil COCs arsenic, dieldrin, toxaphene, and total chlorinated pesticides. The analytical results of these samples are presented on Table 2 and shown on Figure 3. The results

indicate the soils in the breezeway area exceeded the surface soil performance standards

The contents of the silo in Area D were also sampled for TCLP and VOCs, SVOCs, and RCRA metals testing to evaluate the disposal of the silo contents. The TCLP results indicate the contents of the silo are nonhazardous and only contained a low concentration of toluene (4.4 milligrams per kilogram). The results are presented on Table 1 and shown on Figure 3.

## **1.0 INTRODUCTION**

This report presents the results of the Phase II Final Design Sampling activities conducted in June 2004 at the Red Panther Superfund Site in Clarksdale, Mississippi. The Final Design Sampling was conducted to collect composite soil samples from the 2-6' below land surface (bls) intervals and 6-10' bls intervals that require excavation. The purpose of the sampling was to determine the appropriate disposal methodology for the soils in Area B during the Phase II Removal. Additional sampling was also performed during the sampling event to evaluate surface soils in two drainage ditches bordering the site, the breezeway area in Area D, and the contents of a silo in Area D.

### **1.1 Background Information**

The Red Panther Superfund site is located in Clarksdale, Coahoma County, Mississippi (Figure 1). The site occupies approximately 6.5 acres off Normandy Avenue and Patton Street, on the south side of the city of Clarksdale. The facility is bordered on the west by East Tallahatchie Avenue, to the south by Springer International, to the north by Graeber Brothers, and to the east by Normandy Avenue. Presently, Coahoma Inc. still uses a portion of the facility as a warehouse.

In 1999, the EPA Superfund Technical Assessment and Response Team (START) conducted surface and subsurface sampling at the site. The sampling effort focused on the drainage ditches (Area A), the former onsite septic tank and drain field (Area B), and the railroad spur located behind the facility at the loading dock area (Area C). Based on the results of the sampling, EPA concluded the site had been impacted by arsenic and organochlorine pesticides and their degradation products including toxaphene, 4,4'-DDT, chlordane, aldrin, dieldrin, endrin, and endosulfan II. Contamination was also found offsite in six drainage ditches.

The Administrative Order on Consent (AOC) between EPA Region IV and the Performing PRPs was finalized in September 2001. The constituents of concern (COCs) for the Red Panther site include arsenic, toxaphene, dieldrin, and total chlorinated pesticides (for surface soils only). The AOC required the work be performed in two Phases. Phase I consisted of the following four components:

- Excavation of surface soils from drainage ditches between the Red Panther property boundaries and Route 49 and the disposal or temporary stockpiling of the excavated material,
- Characterization of onsite soils and the remaining ditch soils,
- Design of Phase II removal activities, and

- 
- Preparation of a Phase II Work Plan detailing additional removal tasks necessary to complete the requirements of the AOC.

Phase II of the removal action consists of the onsite soil removal activities.

In 2001, the PRPs retained Newfields and URS to prepare a Phase I Removal Action Work Plan, including a Sampling and Analysis Plan (SAP), Quality Assurance Project Plan (QAPP), Site Safety and Health Plan (SSH), and to ascertain acceptable surface and subsurface soil performance standards prior to conducting the Phase I Removal Action at the facility. The Phase I Work Plan was submitted to EPA Region IV on May 24, 2002 and was subsequently approved on September 4, 2002.

Ditch soil characterization work was performed in June 2002 in accordance with the work plan. Soil samples were collected from six drainage ditches that border or are directly affected by runoff drainage from the site. Composite soil samples were collected from the 0-1 and 1-2 foot interval bls and analyzed for total chlorinated pesticides and arsenic. In August 2002, a technical memo was prepared and submitted to EPA Region IV requesting several modifications to the Phase I Work Plan based on the results of the ditch characterization sampling. Specifically, the modifications involved addressing Ditches 5 and 6 under the Phase II Work Plan instead of Phase I, installing a security fence around Ditches 5 and 6 to prevent public access, and establishing eight soil sampling grids in Ditches 5 and 6. EPA Region IV approved the modifications as part of the original work plan. A revised schedule was submitted to EPA in October 2002, based on the results of the ditch characterization sampling to extend the due date of the Site Soil Characterization report. EPA Region IV approved this request on October 30, 2002.

The Phase I Removal Action was performed in November and December of 2002. During the Removal Action approximately 825 tons of soil was removed from the offsite Ditches 1, 2, 3, and 4. The excavated soils were disposed offsite as a nonhazardous waste at the Waste Management, Robinson (Tunica) Mississippi, Subtitle D landfill. After the soils were removed, confirmation soil sampling was performed to determine if the ditches met the subsurface soil performance standards. Based on the confirmation analytical data, Ditches 3 and 4 met the subsurface soil performance standards and were subsequently backfilled. A portion of Ditch 1 (65 feet) still exceeds the subsurface soil standards for toxaphene and dieldrin. This portion of the ditch was also backfilled, and the soils exceeding the performance standards will be addressed in the Phase II Work Plan. The Phase I Removal Action was documented in a report entitled Phase I Removal Action (dated March 18, 2003). The report was submitted to EPA and approved on April 10, 2003.

In December 2002, URS performed the soil characterization, which consisted of sampling the

---

surface and subsurface soils and analyzing the samples for the site constituents of concern (COCs). This report (Report Phase I Soil Characterization, March 18, 2003) was submitted to EPA in March 2003 and approved on April 10, 2003.

In July 2003, Newfields submitted a Phase II Preliminary Design Work Plan to EPA Region IV. The Phase II Preliminary Design Work Plan presented the preliminary excavation cutlines based on the site characterization data, a Performance Standards Verification Plan to confirm achievement of the project performance standards, and the supplemental sampling to be performed to confirm the lateral boundaries of the excavation cutlines and further characterization of the site soils for disposal purposes. On November 14, 2003 EPA Region IV provided comments on the Phase II Preliminary Design Work Plan based upon EPA's site visit in October 2003. On December 15, 2003, the PRP's responses to EPA's November 14, 2003 comments were forwarded to EPA. On January 16, 2004, a conference call was held between EPA, Newfields, and URS to discuss the response to comments on the Draft Phase II Preliminary Design Work Plan and implementation of the Supplemental Sampling. EPA subsequently issued a letter on February 13, 2004 documenting any remaining EPA issues or comments on the Phase II Work Plan and the approval of the Supplemental Sampling.

In February of 2004 URS performed the Supplemental Sampling which consisted of collecting additional soil samples to confirm the lateral boundaries of the excavation cutlines in Areas B, C, and D, evaluation and sampling of the 8 ASTs in the Area B Tank Farm, and collecting composite soil samples from Areas B, C, and D for assessment of the soils management and disposal final design. The results of this sampling was presented in a report entitled "*Phase II Supplemental Sampling Draft Report, Red Panther Site, Clarksdale, Mississippi*" dated May 13, 2004.

On June 2, 2004 a meeting was held between representatives of EPA, Alston & Bird, Newfields, and URS to review the February 2004 Supplemental Sampling results and to finalize a schedule for the Phase II Removal. The results of the meeting were documented in a letter to EPA dated June 11, 2004.

In June 2004, URS performed the Phase II Final Design Sampling, which included TCLP testing of the subsurface soils (soils greater than 2 feet below land surface) in Area B, additional ditch sampling east and south of the facility, and sampling of the "breezeway" and the contents of the silo in Area D. Specifically, 7 subsurface TCLP samples were collected in Area B where the soils exceeded the performance standards and require excavation. The TCLP samples were collected from the 2-6 foot bls interval and 6-10 foot bls interval of the planned excavations in Area B. The samples were analyzed for the complete list of TCLP parameters and for total RCRA metals, VOC, and SVOCs to evaluate the disposal options for these soils. The samples collected from the breezeway and the two drainage ditches were analyzed for the surface soil

---

COCs for comparison to the performance standards. This report presents the results of the Final Design Sampling.

## **2.0 PHASE II FINAL DESIGN SAMPLING**

### **2.1 Purpose**

The scope of work for the Phase II Final Design Sampling included the following:

- collecting additional TCLP composite soil samples from the subsurface soils in Area B to evaluate the disposal options for these soils, and
- collecting surface soil samples from the breezeway area in Area D and from two drainage ditches bordering the eastern and southern portions of the site to evaluate if these soils exceeded the surface soil performance standards.

### **2.2 Phase II Final Design Sampling Activities**

The Phase II Final Design Sampling activities were performed from June 28, 2004 to June 29, 2004. All sampling was performed in accordance with the Phase II Preliminary Design Work Plan. All sampling equipment and DPT equipment was decontaminated in accordance with the procedures outlined in the SAP and QAPP. The investigative derived waste generated during the investigation was containerized and stored onsite, pending disposal during the Phase II Removal Action.

Prior to the start of the sampling, URS marked the sample locations. URS retained W.L Burle Engineers Inc. to install the soil borings utilizing a DPT rig and to survey the boring locations at the completion of the Phase II Final Design Sampling. Atlanta Environmental Services (AES) performed the laboratory analysis of the samples.

### **2.3 TCLP Sampling**

Seven soil intervals in Area B requiring excavation were individually sampled during the TCLP sampling event (TCLP 14 2-6', AB TCLP 14 6-10', AB TCLP 15 2-6', AB TCLP 16 2-6", AB TCLP 17 2-6', AB TCLP 17 2-6', AB TCLP 6-10', and AB TCLP 18 2-6'). A composite of the seven intervals was formed and analyzed prior to analyzing the individual samples. The composite TCLP sample was formed by compositing the aliquots from each of the seven soil intervals into one sample (AB TCLP Comp). The remaining aliquot from each individual sample was then utilized to form a sample for that interval. The TCLP samples were submitted to AES in Atlanta, Georgia for analytical testing of total VOCs, SVOCs, chlorinated pesticides, RCRA metals and TCLP testing for VOCs, SVOCs, pesticides, herbicides, and RCRA metals.

The composite sample (AB TCLP Comp) was analyzed first and the individual samples placed

on hold at the laboratory pending the results of the composite sample. After the results of the composite sample indicated the TCLP regulatory limits for arsenic (5.0 mg/L) were exceeded, the individual samples were released from hold for analysis.

The analytical results for the TCLP samples are presented on Table 1 and shown on Figure 2. A copy of the analytical data is provided in Appendix A. The TCLP analytical results for the individual intervals were compared to the regulatory limits to evaluate which soils may be designated a characteristic hazardous waste if excavated. The analytical results from Area B indicated that five of the seven samples (AB TCLP 14 2-6', AB TCLP 14 6-10', AB TCLP 15 2-6', AB TCLP 16 2-6', and AB TCLP 17 6-10') exceeded the TCLP regulatory limits for arsenic and would be classified as a characteristic waste.

After evaluating the TCLP data, the totals data for the samples exceeding the TCLP regulatory limits were compared to the Universal Treatment Standards (UTS). If a material is designated as a hazardous waste by TCLP testing, then the underlying constituents in the waste must be evaluated to determine if treatment for any underlying constituents is required. If an underlying constituent exceeds ten times it's UTS then the waste would have to be treated for that constituent (in addition to the constituent failing TCLP) until the concentration is less than ten times the UTS before the soils could be landfilled.

Review of the TCLP and totals data indicates the UTS for underlying constituents were not exceeded in the five composite samples that exceeded the TCLP regulatory limits for arsenic.

#### **2.4 Additional Sampling**

DPT borings were installed in the drainage ditch east of Normandy Avenue and in the drainage ditch south of the former Sasse Street, which forms the southern border of Area D. Two DPTs were installed in each ditch (Figure 3) to evaluate the surface soils (0-2' bls). Soil samples were collected from these borings at 0-2' bls. Surface soil sampling was also performed in the breezeway area in Area D. Two surface soil samples (0-1' bls) were collected from the soils in the breezeway. One sample was collected from the eastern side and one from the western side of the breezeway. The silo in Area D was sampled to evaluate the contents for disposal during the Phase II Removal.

The surface soil samples were collected and handled using standard sampling protocol procedures as outlined in the SAP and QAPP. A URS Engineer logged the borings and the soils classified according to the Unified Soil Classification System. Copies of the boring logs are included in Appendix A. The soil samples were submitted to AES in Atlanta, Georgia for analytical testing. The soil samples from the drainage ditches and the breezeway were analyzed for the surface soil COCs arsenic by EPA Method 6010 and dieldrin, toxaphene, and total

chlorinated pesticides by EPA Method 8081A. The silo sample was submitted for TCLP and VOCs, SVOCs, and RCRA metals analysis.

The analytical results of the surface soil samples are presented on Table 2. A copy of the chain-of-custodices and the analytical data are provided in Appendix C. The analytical results for the COCs (arsenic, dieldrin, toxaphene, and total chlorinated pesticides) in the ditches and the breezeway are shown on Figure 3. The analytical results for the silo sample are presented on table 1 and shown on Figure 2. The analytical results of the silo sample indicate the contents are nonhazardous and only contained low concentrations of toluene.

## **2.5 Investigative Derived Waste**

All decontamination fluids were collected and stored onsite in 55-gallon drums. These drums were properly labeled identifying the contents of the drums. The drums are stored in Area B inside the fenced-in area. The soil cuttings generated from the installation of the soil borings were stored along with soil stockpiled from Ditch 1. The drums of decontamination fluids and the soil cuttings will be disposed of offsite during Phase II Removal

RE: Red Panthers Pesticide Site

Order No.: 0407035

Dear Brent Jacobs:

Analytical Environmental Services, Inc. received 10 samples on 7/1/2004 9:55:00 AM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative. AES' certifications are as follows:

- NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water, effective 06/01/04-04/30/05.
- AIHA Certification number 505 for analysis of Air, Paint Chips, Soil and Dust Wipes, effective until 02/01/07.

These results relate only to the items tested. This report may only be reproduced in full and contains 13 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

Allison Cantrell  
Project Manager

**CLIENT:** URS  
**Project:** Red Panthers Pesticide Site  
**Lab Order:** 0407035

**CASE NARRATIVE**

Per Brent Jacobs request on 07/09/04, multiple samples and fractions were taken off hold for additional analyses. All additional parameters will be analyzed at standard turnaround time per client request. Client requested Full TCLP, Volatile, Semivolatile, 8 RCRA Metals, and Pesticide analyses for all samples with sample ID "TCLP."

**Sample Receipt Non-Conformance:**

A Trip Blank was provided but is not listed on the COC. Per client and project history, trip blank will be analyzed.

One vial was received broken for each sample: "AB TCLP 18 2-6", "AB TCLP Comp".

**Metals Analysis by Method 6010B:**

Matrix spike recoveries for barium and lead on sample 0407058-002B were outside control limits biased low. LCS recovery was within control limits indicating possible matrix interference.

Matrix spike recoveries for arsenic and selenium on sample 0407035-009C were outside control limits biased low. LCS recovery was within control limits indicating possible matrix interference.

**Volatile Organic Compounds Analysis by Method 1311:**

Percent recovery for the surrogate spiking compound 4-Bromofluorobenzene on sample 0407035-006D was outside control limits biased high due to suspected matrix interference. All other surrogate recoveries were within control limits.

**Semi Volatile Organics Analysis by Method 8270C:**

LCS-47390 recovery for pentachlorophenol was outside control limits biased high. Target analyte was not detected in the analytical samples and data is reportable with high bias.

Matrix spike recoveries for four spiking compounds and two surrogate compounds on sample 0407035-009B were outside control limits biased low due to matrix interference. LCS recovery was within control limits except as described above.

Matrix spike duplicate recoveries for three spiking compounds and one surrogate compound on sample 0407035-009B were outside control limits biased low due to matrix interference. LCS recovery was within control limits except as described above.

**Volatile Organic Compounds Analysis by Method 8260B:**

**CLIENT:** URS  
**Project:** Red Panthers Pesticide Site  
**Lab Order:** 0407035

## CASE NARRATIVE

Due to sample matrix, samples 0407035-001A, -003A, -004A, -005A, and -006A required dilution during preparation and/or analysis resulting in elevated reporting limits.

### Pesticide Analysis by Method 8081:

Due to sample matrix interference, samples 0407035-006B, -007A, -008A, -009B, -009BMS and -009BMSD required dilution during analysis resulting in elevated reporting limits, and surrogate and spiking compound recoveries outside control limits.

Dieldrin value for the QC sample 0406F09-006BMS is "E" qualified indicating an estimated value over linear calibration range due to the level of target analyte present in the unspiked sample.

"NC" (Not Confirmed) qualifier indicates tentative target compound ID due to >40% relative percent difference between primary and confirmation column. SW-846 requires that the highest value be reported and the data qualified when significant disagreement between columns occurs.

Percent recovery for the surrogate spiking compounds Decachlorobiphenyl and Tetrachloro-m-xylene on sample 0407035-002 was outside control limits biased low due to suspected matrix interference. All other surrogate recoveries were within control limits.

### Herbicide Analysis by Method 8151:

Due to sample matrix interference, samples 0407035-009B, -009BMS and -009BMSD required dilution during analysis resulting in elevated reporting limits and surrogate and spiking compound recoveries outside control limits.

RE: Red Panthers Pesticide Site

Order No.: 0406F09

Dear Brent Jacobs:

Analytical Environmental Services, Inc. received 10 samples on 6/30/2004 9:55:00 AM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative. AES' certifications are as follows:

- NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water, effective 06/01/04-04/30/05.
- AIHA Certification number 505 for analysis of Air, Paint Chips, Soil and Dust Wipes, effective until 02/01/07.

These results relate only to the items tested. This report may only be reproduced in full and contains 601 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

Allison Cantrell  
Project Manager

See Case Narrative for resolution of the Non-Conformance.

\* Samples do not have to comply with the given range for certain parameters.

**Analytical Environmental Services, Inc.**

Date: 19-Jul-04

CLIENT: URS  
Project: Red Panthers Pesticide Site  
Lab Order: 0406F09

**CASE NARRATIVE**

Per Brent Jacobs 7/1/04, prep samples TCLP 14 2-6 and TCLP 14 6-10 for TCLP Analysis.

Per Brent Jacobs request on 07/09/04, multiple samples and fractions were taken off hold for additional analyses. All additional parameters will be analyzed at standard turnaround time per client request.

Analyze the samples listed below for Dieldrin, Toxaphene, and As.

D1E DPT1 1-2

D1E DPT2 1-2

ADSD DPT1 1-2

ADSD DPT2 1-2

Also, analyze samples TCLP14 2-6 and TCLP 14 6-10 for Full TCLP, totals for RCRA metals, VOCs, SVOCs, and Pesticides.

Per Brent Jacobs 7/14/04, report all 8081 compounds for all samples in this workorder. Dieldrin and Toxaphene only were previously requested.

**Pesticide Analysis by Method 8081:**

"NC" (Not Confirmed) qualifier indicates tentative target compound ID due to >40% relative percent difference between primary and confirmation column. SW-846 requires that the highest value be reported and the data qualified when significant disagreement between columns occurs.

Percent recovery for the surrogate spiking compounds Decachlorobiphenyl and Tetrachloro-m-xylene on sample 0406F09-005, -007 and -008 were outside control limits biased low due to suspected matrix interference. All other surrogate recoveries were within control limits.

Dieldrin value for the QC sample 0406F09-006BMS is "E" qualified indicating an estimated value over linear calibration range due to the level of target analyte present in the unspiked sample.

**Volatile Organic Compounds Analysis by Method 8260B:**

Sample 0406F09-010A was analyzed outside holding time of 14 days.

Due to sample matrix, samples 0406F09-009A and -010A required dilution during preparation and/or analysis resulting in elevated reporting limits.
