# Agenda

- Introduction
  - E-Enterprise Advanced Monitoring Recommendations
- Sensor Data Messaging
- PM<sub>2.5</sub> Sensor Field Study
- Questions

# Introduction - Proliferation of Sensors

**21st Century 'Canary in a Coal Mine'**  
 The Pigeon Air Patrol — a joint project by tech companies Plume Labs and DigitasLBI — released pigeons outfitted with air-monitoring packs to record and report real-time air pollution levels in London. This three-day venture was used to spread awareness on London's smog problem.

**WHAT IT IS**  
 Racing pigeons wear a small fabric vest outfitted with a feather-light backpack.

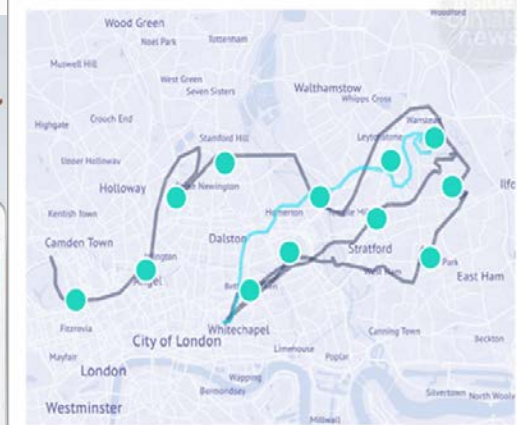

**Lightweight fabric harness**

**Air monitor detects ozone and nitrogen dioxide**

One pigeon wore a GPS device instead of an air monitor.

**HOW IT WORKED**  
 Londoners Tweeted their location to a Pigeon Air team member and received real-time results (via Twitter) of air quality in their area.

## E-Enterprise Advanced Monitoring Team (EEAMT) Recommendations

- E-Enterprise Leadership endorsed five recommendations in April 2016
- Members: States (organized by ECOS), OAR, ORD, OECA, OW, OEI, and EPA Regions 1 & 2

### **Recommendations:**

#1: Feasibility study for a voluntary 3<sup>rd</sup> party certification program

#2: Technology screening and support network

- Recommendations 1 & 2 will build on lessons learned from sensor evaluations and pilot projects  
<https://www.epa.gov/air-research/air-sensor-toolbox-citizen-scientists>

#3: Interpretation of data from advanced monitoring approaches

- Finalize & expand pollutant list for prototype website that messages short term, real-time measurements  
<http://bit.ly/VillageGreenPilot>

#4: Data standards & data quality tiers

#5: Lean technology evaluation parameters

# Introduction

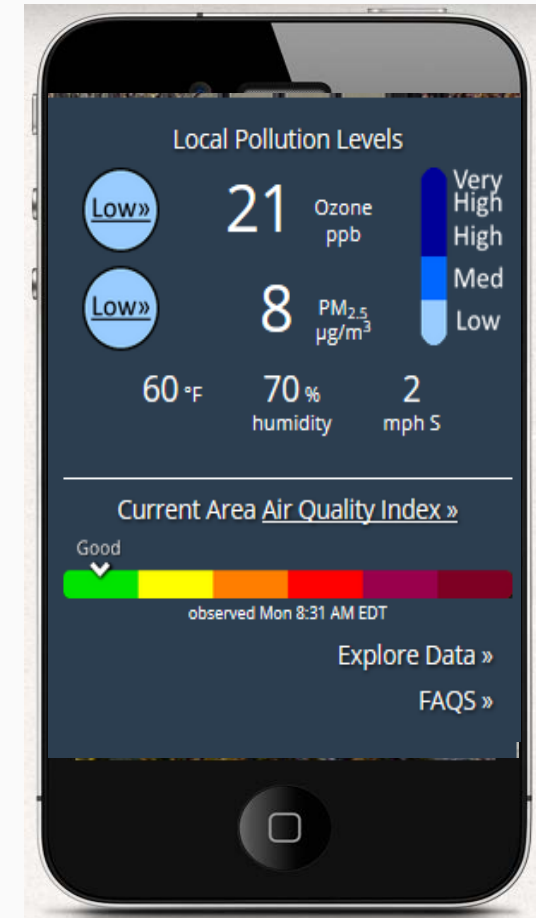

- There is a great deal of growth in the availability, use, and quality of air quality sensors
- Sensor technology has great potential to empower people to understand local air quality but communicating real-time data is complicated
- Health studies do not support linking short term (e.g. 1-minute  $O_3$  or  $PM_{2.5}$ ) exposures to adverse health effects
- Many developers are incorrectly using whatever information is currently available, e.g., AQI

# Sensor Scale Pilot Project

- On May 6<sup>th</sup>, EPA launched a new “sensor scale”
  - EPA developed the scale to help the public understand 1-minute data from Village Green stations
- Pilot appears on existing Village Green data webpage
  - <http://bit.ly/VillageGreenPilot>
- A fact sheet, FAQs, and other information available on the Air Sensors Toolbox
  - <https://www.epa.gov/air-research/air-sensor-toolbox-citizen-scientists>
- EPA is testing the effectiveness of the scale and messages during a spring-summer 2016 pilot project

# Previous Village Green Website

The screenshot shows a web browser window displaying the Village Green Project website. The browser's address bar shows the URL: <https://www.airnow.gov/index.cfm?action=airnow.villagegreen>. The website features a header with the Village Green Project logo and a navigation menu. A large image of a weather station is shown, with a red circle highlighting a data overlay. The overlay displays the following information:

Most Recent Observations  
Durham, NC

27	Ozone ppb	52.5 °F
0	PM <sub>2.5</sub> µg/m <sup>3</sup>	46% humidity
		3.1 mph W

observed Fri 9:06 AM EDT

Explore Durham, NC

Below the weather station image, the website has a blue banner with the text: "Welcome to the Village Green Project" and "a research effort to discover new ways of measuring air quality and weather conditions in community environments." Below this banner are three icons representing the project's goals:

- Measuring and communicating on-the-spot air quality and weather conditions for research and awareness
- Developing small and rugged data collection systems that can be powered by the wind and sun
- Partnering with communities to pilot test the new technology in outdoor community spaces.

The Windows taskbar at the bottom shows the time as 9:11 AM on 4/8/2016.

FAQS »

## Welcome to the Village Green Project

a research effort to discover new ways of measuring air quality and weather conditions in community environments.

Measuring and communicating on-the-spot air quality and weather conditions for research and awareness

Developing small and rugged data collection systems that can be powered by the wind and sun

Partnering with communities to pilot test the new technology in outdoor community spaces.

About Village Green »

*Data shown on these pages are preliminary and subject to change.*

# Ozone Breakpoints and Messages

Pilot version <b>1-Minute Ozone Readings</b> <i>Not for regulatory purposes</i>	
<b>Low</b> <b>0-59 ppb</b>	Enjoy your outdoor activities.
<b>Medium</b> <b>60-89 ppb</b>	If medium readings continue, use the Air Quality Index to plan outdoor activities.
<b>High</b> <b>90-149 ppb</b>	If high readings continue, consider adjusting outdoor activities, especially if you are sensitive to ozone. Check the Air Quality Index to find out.
<b>Very High</b> <b>≥150 ppb</b>	If high readings continue, consider adjusting outdoor activities. Check the Air Quality Index to find out. Very high readings may mean the sensor is not working properly.
	Sensor may be offline. Check the Air Quality Index.

# PM<sub>2.5</sub> Breakpoints and Messages

Pilot version 1-minute particle pollution (PM <sub>2.5</sub> ) readings <i>Not for regulatory purposes</i>	
<b>Low</b> 0-29 ug/m <sup>3</sup>	Enjoy your outdoor activities.
<b>Medium</b> 30-69 ug/m <sup>3</sup>	If medium readings continue (for an hour or more), use the Air Quality Index to plan outdoor activities.
<b>High</b> 70 - 499 ug/m <sup>3</sup>	You may be near a source of particle pollution like dust, smoke or exhaust. Check the Air Quality Index to plan outdoor activities.
<b>Very High</b> ≥500 ug/m <sup>3</sup>	You may be near a source of particle pollution like dust, smoke or exhaust. Check the Air Quality Index to find out if you should adjust outdoor activities. Very high readings may mean the sensor is not working properly.
	Sensor may be offline. Check the Air Quality Index.

# Ozone Sensor Breakpoints

- Used available air quality data, together with judgments about the objectives for each sensor category
- Air quality analyses link 1-minute to 8-hour O<sub>3</sub> concentrations to inform sensor breakpoints without reinterpreting the health evidence
- ~7.6 million one minute ozone values from 18 sites (4 Village Green locations and 14 FRM)

## AQI Categories (8-hr)

## Potential Sensor Categories (1-min)

# PM<sub>2.5</sub> Sensor Breakpoints

- For PM<sub>2.5</sub>, the available 1-minute data is more limited than for O<sub>3</sub>
  - **5 monitors provide 1-minute PM<sub>2.5</sub> data (DC, PA, KS, NC, NY)**
- PM<sub>2.5</sub> concentrations can exhibit sharp spatial and temporal gradients, with the potential for extremely high concentrations near sources
- PM<sub>2.5</sub> AQI categories are based on 24-hour concentrations; 24-hour PM<sub>2.5</sub> NAAQS is 35 µg/m<sup>3</sup>

## **Near-Source Concentrations**

1. Designated smoking areas:  
~ 70 to > 500 µg/m<sup>3</sup>
2. Near/on diesel buses:  
~ 75 to > 1,000 µg/m<sup>3</sup>
3. Near street paving operation:  
~ 80 µg/m<sup>3</sup>
4. Near candles/cooking  
~ 100 to > 1,000 µg/m<sup>3</sup>

# Analytical Approach for PM<sub>2.5</sub>

## Low breakpoint (30 µg/m<sup>3</sup>):

- Considered relationship between 1-hour and 24-hour PM<sub>2.5</sub> concentrations
- Much more data available to identify relationships with 1-hour concentrations – almost 400 monitors covering most states
- One-hour PM<sub>2.5</sub> concentrations are better predictors of 24-hour concentrations

## Upper breakpoint (70 µg/m<sup>3</sup>):

- Identification of PM<sub>2.5</sub> concentration ranges that have been measured near sources like bus terminals, smokers, cooking – high sensor readings should warn people that they may be near a PM source
- In response to high readings, people may be able to move away from sources and reduce their exposures

# Next Steps

- EPA is piloting “sensor scale” messaging
- Village Green website has a “contact us” link
- Based on feedback, EPA will update the scale and messages as appropriate. Our goal is make them available to sensor developers later this year.
  - Note: Earlier versions of the information shown in the tables and the mobile website have been focus tested, and we have solicited previously from other stakeholders – EPA plans to continue soliciting feedback

# PM<sub>2.5</sub> Sensor Field Study - Overview

1  
5

**Main Objective:** Examine the use of low-cost particulate matter (PM) sensors for answering questions about Tribal air quality

Monitoring is being conducted in two phases:

**Phase 1:** Collocation of the sensors with existing PM<sub>2.5</sub> Federal Reference Method (FRM) monitor

**Phase 2:** Monitoring near a local source to examine impacts on local air quality and nearby PM concentration gradients

# Study Design

- One MicroPEM and two AirBeam sensors were evaluated
- Sensor selection was based on past performance during EPA testing, cost, durability, mobility, and ease of use

AirBeam

RTI MicroPEM

Internal components of the AirBeam sensor

# Project Status

1  
7

- Phase 1 - Collocation monitoring
  - Data were collected October 22, 2015
  - June 13, 2016
  - Data analysis performed on data collected October 22, 2015 – February 28, 2016
- Phase 2 - Near-source monitoring
  - Data were collected June 13, 2016 - present\*

\*As of August 2016, sensor data are still being collected at a near-source site.

# Phase 2: Near-Source Monitoring

- Collected data near a 1940's boiler/kiln on June 13-17, 2016
  - MicroPEM and both AirBeams (AirBeam A is working under more moderate, summertime conditions)
- Performed meteorological forecasts 1-day ahead to determine which site to monitor at each day given forecasted prevailing winds
- Set up a small meteorological tripod to monitor wind speed and direction
- Performed mobile monitoring with one AirBeam to examine spatial gradients near the source

# Phase 2: Study Design

# Phase 2: Preliminary Results

Next Step:  
Analyze data and determine comparability of sensor readings under ambient vs. near- source conditions

Preliminary Results – Do Not Cite or Quote

# Sensor Study - Observations & Next Steps

- Observations

- AirBeams performed inconsistently (one performed well despite harsh conditions, other did not perform)
- MicroPEM required frequent in-field calibration and substantial post-processing using data from a second sensor
- Multiple off-the-shelf sensors should be used to collect sensor data

- Next Steps

- Analyze collocation and near-source sensor data
- Consider effect of particle size/shape in reading of sensor

# Questions
