Re: Revised Comprehensive Site-Wide Sampling and Analysis Program Report  
Former Romic Environmental Technologies Corp. Facility  
East Palo Alto, California  
Administrative Order on Consent U.S. EPA Docket No. RCRA-09-88-0015

Dear Mr. Leach:

On behalf of Bay Enterprises, Iris Environmental is submitting the enclosed Revised Comprehensive Site-Wide Sampling and Analysis Program Report (“Revised CSAP Report”) for the former Romic Environmental Technologies Corp. Facility in East Palo Alto, California. The Revised CSAP Report was prepared in accordance with the closure and corrective action requirements specified in the Administrative Order on Consent, and reflects comments received from USEPA and DTSC on January 28, 2013.

Please do not hesitate to contact me at (510)-834-4747 x21 or [calger@irisenv.com](mailto:calger@irisenv.com) if you have any questions or comments regarding this submittal.

Sincerely,  
IRIS ENVIRONMENTAL

## PROFESSIONAL CERTIFICATION

This *Revised Comprehensive Site-Wide Sampling and Analyses Program Report* for the Former Romic Environmental Technologies Corporation Facility, located at 2081 Bay Road in East Palo Alto, California has been prepared by and under the direct supervision of a California Professional Geologist.

Christopher S. Alger, PG, CEG, CHG  
Principal Engineering Geologist

Other Iris Environmental authors of this Report include:

Darren Croteau, PG, Senior Geologist

Steve Mack, Senior Scientist

## ACRONYMS

1,1-DFA	1,1-difluoroethane
µg/L	micrograms per liter
AOC	Area of concern
ASTM	American Society for Testing and Materials
bgs	below ground surface
Cal/EPA	California Environmental Protection Agency
CHHSL	California Human Health Screening Level
cis-1,2 DCE	cis-1,2 Dichloroethene
CMIP	Corrective measures implementation plan
COCs	Constituents of concern
CPT	Cone penetrometer test
CSAP	Comprehensive Site-Wide Sampling and Analysis Plan
DRO	Diesel range organics
DTSC	Department of Toxic Substances and Control
DWR	Department of Water Resources
ERD	Enhanced reductive dechlorination
FEMA	Federal Emergency Management Agency
ft/ft	Feet/foot
GCC	Groundwater Committee of California
GRO	Gasoline range organics
HLA	Harding Lawson and Associates
HTU	High temperature unit
IDW	Investigation derived waste
LCS(D)	Laboratory control standard (duplicate)
MS(D)	Matrix spike (duplicate)
MCL	Maximum contaminant level
MDL	Method detection limits
mg/kg	Milligrams per kilogram
mL/min	milliliter per minute
MORO	Motor oil range organics
msl	mean sea level
NPDES	National Pollution Discharge Elimination System

OEHHA	Office of Environmental Health Hazard Assessment
PAHs	Polycyclic aromatic hydrocarbons
PCBs	Polychlorinated biphenyls
PCE	Tetrachloroethene
PG&E	Pacific Gas and Electric
PID	Photo-ionization detector
PVC	Poly vinyl chloride
QA/QC	Quality assurance/Quality control
RBD	Ravenswood Business Development
RCRA	Resource Conservation and Recovery Act
RBTCs	Risk based target concentrations
RL	Reporting limits
Romic	Romic Environmental Technologies Corporation
RPD	Relative percent difference
RSL	United States Environmental Protection Agency Regional Screening Level
RWQCB	Regional Water Quality Control Board
SVOCs	Semi-volatile organic compounds
SWMUs	Solid waste management units
SWPPP	Stormwater Pollution and Prevention Plan
TBA	Tertiary-butyl alcohol
TEG	Transglobal Environmental Geochemistry
TCE	Trichloroethene
TPH	Total petroleum hydrocarbon
trans-1,2 DCE	trans-1,2 Dichloroethene
TW	Truck wash
UCL	Upper confidence limit
USEPA	United States Environmental Protection Agency
USCS	Unified soil classification system
USA	Underground service alert
VOCs	Volatile organic compounds

## 1.0 INTRODUCTION

On behalf of Bay Enterprises, Iris Environmental has prepared this Revised Comprehensive Site-Wide Sampling and Analysis Report (Report) for the Former Romic Environmental Technologies Corporation Facility (Romic, the Site, Figure 1) in East Palo Alto, California. This report describes a comprehensive soil, groundwater, and soil vapor investigation conducted at the Site. This revised Report supersedes the version submitted on November 1, 2012. The purpose of this investigation was to identify the nature and extent of soil contamination in the vadose zone across the entire facility. In addition, the nature and extent of groundwater contamination and soil vapor (also referred to as “soil gas”) was also evaluated in some areas of the Site. The goal of the investigation was to identify impacted areas of the Site and collect sufficient data to complete closure of the permitted units under Resource Conservation and Recovery Act (RCRA) and to support development of the Corrective Measures program and Corrective Measures Implementation Plan (CMIP).

The investigation was performed in general accordance with the *Comprehensive Site-Wide Sampling and Analysis Plan* (CSAP, Iris Environmental, 2011a). The CSAP was conditionally approved by the United States Environmental Protection Agency (USEPA) Region IX in a letter to Mr. Christopher Alger of Iris Environmental dated June 15, 2011. Official notice was presented to USEPA in June 27, 2011 and the investigation began on July 11, 2011.

Following observation of changed conditions at the Site during the investigation, Iris Environmental submitted an *Addendum to Comprehensive Site-Wide Sampling and Analysis Plan* (Iris Environmental, 2011b). The addendum presented proposed changes to the CSAP work plan to increase the density of borings in the Northern Area. The addendum was conditionally approved by the USEPA in a letter to Mr. Christopher Alger of Iris Environmental dated August 19, 2011. The addendum was revised and reissued on August 22, 2011 as the *Revised Addendum to Comprehensive Site-Wide Sampling and Analysis Plan*, (Iris Environmental, 2011c).

The CSAP proposed sampling in various permitted units and other potential source areas of the Site, and these areas are shown on Figure 2. The permitted units are:

- Drum Crusher (north storage building);
- South Drum Storage Building;
- Drum Sampling Area;
- Liquefaction Unit;
- High Temp Unit;
- Truck Wash Unit;
- West Storage Building #2;

- Tank Farms, including A, B, CLR, D, G, H, I, J, K, MNO, Q, (Tank Farms E, F, S, T and U were never constructed);

In addition to the permitted units, twenty different Solid Waste Management Units (SWMUs) were investigated and include:

- Former Pond Areas (East and West)
- Waste Discharge Trough
- Historical Drummed Waste Storage Areas
- West Storage Area
- Process Area Sump
- Truck Parking Area
- Drummed Waste Staging Area
- Drum Crushing Area
- South Drum Storage Building
- North Drum Storage Building
- CSR Drum Storage Building
- Bulk Waste Storage Waste Area (Green Tanks)
- Bulk Waste Storage Area (Brown Tanks)
- Centrifuge
- Centrifuge Roll-off Bins
- Administration/Laboratory Building Septic Tank and Drain field
- Process and Sanitary Sewer System and Wastewater Surge Tank
- Surge Tank Separator
- Runoff Sump Separator

Due to the large number of permitted units and potential sources areas, Iris Environmental grouped the areas geographically and by similar features and Site uses into larger, more inclusive areas. The grouping of the areas and the areas as they will be discussed in this report are listed in the table below. These areas are shown on Figure 2.

Area of Concern Identified in CSAP	Area Discussed in Report
High Temp Unit	Central Processing Area
Tank Farms A and B	
Tank Farm CLR	
Tank Farm D	
Tank Farm G	
Tank Farm H	
Tank Farm I and J	
Tank Farm K	
Tank Farm MNO	
Drum Crusher HWMU	Northern Area
Drum Crushing Area	
Liquefaction Area	
North Drum Storage Area	Northern Area & Central Processing Area
Septic Tank	
Runoff Sump	Panhandle and Eastern Area
Truck Wash	Truck Wash Area
Truck Parking Area	Western Area
Onsite Auto Wrecking Yards	
Surge Tank	
Tank Farm Q	
West Storage Building 2	
South Drum Storage Area	Western Area & Central Processing Area

The results of soil, groundwater, and soil vapor sampling performed for this investigation are described in the following sections of this report.

This report is organized as follows: Introduction (Section 1.0); Background (Section 2.0); Field and Laboratory Methods (Section 3.0); Results (Section 4.0); Background Metals in Soil (Section 5.0); Management of Investigation Derived Waste (Section 6.0); Data Quality Review (Section 7.0); Data Discussion (Section 8.0); Conclusions (Section 9.0); Recommendations (Section 10.0); and References (Section 11.0).

## 2.0 BACKGROUND

This section presents the physical and geologic setting for the Site followed by a summary of previous investigations.

### 2.1 Site Location and Physical Description

The Site encompasses approximately 12.6 acres in East Palo Alto, San Mateo County, approximately 0.5 mile west of the San Francisco Bay (Figure 1). This area of East Palo Alto is zoned for light and heavy industrial use. Residential areas are located approximately 0.3 miles to the west and 0.4 miles to the south-southeast of the Site. Adjacent to the Site, primarily to the west and south, are auto-wrecking yards, an electrical substation, and a chemical manufacturing plant. Two tidal sloughs define the northern and eastern Site boundaries. Further east are a levee, presently used as a hiking and biking trail, and a 130-acre former saltwater evaporation pond now comprising a reconstructed marsh and wetlands.

Surface elevations across the Site range between 5 and 11 feet above mean sea level (msl). Runoff follows surface topography and the adjacent areas to the north and west drain toward the Site. The Site is located within the 100-year flood plain established by the Federal Emergency Management Agency (FEMA, 1984), although Romac has added fill and levees to mitigate flooding hazards. Portions of the Site have been filled with various materials including silts, sands, and possible construction/demolition debris. A levee protects the Site from tides and storm surges on the northern and eastern property lines.

There are two unnamed tidal sloughs, to the north and east of the Site, which roughly correlate with the Site property boundaries in these areas. These sloughs drain surface water from the marshland area north and east of the Site. Surface water in the north slough drains into the east slough at the northeast corner of the Site. The east slough flows south along the eastern property boundary, and then turns east connecting to the San Francisco Bay. Surface water is monitored and managed by Romac in accordance with a storm water pollution and prevention plan (SWPPP).

The area along the Bay interior is currently undergoing a rejuvenation of public interest, and possible beneficial uses include wildlife habitat, preservation, and terrestrial and aquatic recreation. The Mid-peninsula Open Space District and several municipalities are considering land reclamation and redevelopment along the waterfront (Conor Pacific/EFW/Henshaw, 1999). Marshland near the Site may be suitable for endangered species such as the California clapper rail (*Rallus longirostris obsoletus*) and the salt marsh harvest mouse (*Reithrodontomys raviventris* [Harding Lawson and Associates (HLA), 1989]).

### 2.2 Geology and Hydrogeology

Bedrock in the area is Cretaceous to Jurassic in age and is part of the Franciscan Formation (Department of Water Resources [DWR], 1967). Near the Site, bedrock elevations have been reported to be approximately 880 feet below msl (the Groundwater Committee of California

Regional Water Quality Control Board, San Francisco Region [GCCRWQCB], 2003).

The Site is located near the southwest shoreline of the San Francisco Bay. The Diablo Range to the east and the Santa Cruz Mountains to the west bound the north-south oriented San Francisco Bay and Bay plain. This structural depression extends north into the Petaluma, Napa, and Sonoma Valleys and south into the San Benito and Santa Clara Valleys.

The Site is located on the San Francisco-Marin or Bay geologic block defined by the San Andreas Fault to the west (9 miles) and the Hayward Fault to the east (10 miles). The inferred location of the San Jose Fault trace, which trends northwest to southeast, may be the western edge of the San Francisco Bay Block and lies relatively close to the Site (HLA, 1989). Surface expression of faulting in the Site vicinity has not been previously reported, and evidence of borehole faulting has not been noted. Faulting is not expected to occur at the Site, and therefore would not impact Site stratigraphy or groundwater flow.

The San Francisco Bay block began to subside in the late Pliocene and Pleistocene, allowing the ocean to transgress inland (Oakeshott, 1978). Worldwide climatic fluctuations during the Pleistocene created sea level fluctuations which filled and emptied the San Francisco Bay. These fluctuations allowed fluvial systems such as the Sacramento River to wash sediments out of the bay when sea level was low and deposit sediments when sea level was high. Highly heterogeneous, unconsolidated sequences of alternating estuarine (bay mud) and terrigenous alluvial clays, silts, and sands have accumulated in the Bay.

Alluvial materials (the Niles and San Francisquito Cones) were shed from the Diablo Range and the Santa Cruz Mountains, respectively (DWR, 1967), which coalesce as alluvial fan deposits. These cones have depositional systems that inherently deposit highly heterogeneous materials. Steep topographical gradients near the sediment source deposit large grain sediments, and debris flows are common. Finer grain material is deposited as the energy of the depositional system decreases at the distal portions of the fan lobe. The Niles and San Francisquito Cones inter-finger in the subsurface of the San Francisco Bay Plain. These sediments are underlain by the Pleistocene Santa Clara Formation (Dibblee, 1966). These sediments comprise two regional aquifers, the Newark and the Centerville. In the immediate Site vicinity, the Newark aquifer has been loosely subdivided into three zones segregated by clays: the A-, B-, and C-zones. The Centerville aquifer is separated from the Newark aquifer by a regional (bay mud) clay aquitard. The Centerville aquifer has been referred to as the D-zone at the Site (Conor Pacific/EFW/Henshaw, 1999).

In addition to native unconsolidated material, extensive fill materials have been emplaced at the Site. The thickness of fill material at the Site ranges between 1 and 14 feet (Conor Pacific/EFW/Henshaw, 1999). The Site-specific geologic and hydrogeologic units are described further in subsequent paragraphs.

The A-zone consists of clayey to silty sands and gravels interbedded with dark silts and clays. Organic-rich layers with plant and root material have also been observed at the Site. The A-zone

ranges in thickness from 7 to 24 feet, and in areas, extends to a depth of approximately -13 feet below msl. Underlying the A-zone is the locally-identified A/B aquitard, ranging between 8 and 25 feet in thickness (Conor Pacific/EFW/Henshaw, 1999). The A/B aquitard is considered laterally discontinuous (HLA, 1991).

The B-zone is similar in composition to the A-zone, with clayey to silty sands and gravels interbedded with sandy silts and clays. The B-zone is considered to be relatively laterally discontinuous and is thinner in the central and northern portions of the Site. The top of the B-zone is located between -10 and -25 feet below msl and ranges in thickness between 3 and 21 feet. Underlying the B-zone is the locally identified B/C aquitard, which ranges in thickness between 9 and 24 feet and contains carbonate fragments. The B/C aquitard is thickest in the northwest and southeast portions of the Site (Conor Pacific/EFW/Henshaw, 1999).

The C-zone is confined and consists of sand and silty sand interbedded with silt and clay lenses. The C-zone is reported to be relatively laterally continuous across the Site, ranging between 11 and 25 feet thick, and is thickest in the central and northern Site areas. The top of the C-zone has been found to range between -39 and -54 feet below msl. The C-zone and the underlying D-zone are separated by a laterally continuous clay aquitard that is found regionally. This unit is predominantly clay, but thin lenses of sand or gravel have been observed. The C/D aquitard is approximately 70 feet or greater in thickness (Conor Pacific/EFW/Henshaw, 1999).

The D-zone is confined and consists of clayey sands and gravels interbedded with clays and clay with gravel. The top of the unit is approximately -151 feet below msl and is approximately 30 feet thick. The D-zone is also underlain by clayey material (Conor Pacific/EFW/Henshaw, 1999).

Groundwater in all the zones at the Site has, in the past, been reported to flow east toward the San Francisco Bay. Prior to remediation efforts, groundwater gradients in the A-, B-, and C-zones had been reported to be between 0.001 and 0.002 feet per foot [ft/ft] (Conor Pacific/EFW/Henshaw, 1999). The groundwater extraction and treatment system had been operated as a Site remediation strategy until approximately November of 2004. Local effects on groundwater levels had been attributed to the presence of several groundwater extraction wells. This system is no longer operational.

The A-zone has a downward hydraulic gradient, and the C-zone has an upward hydraulic gradient in relation to the B-zone (Conor Pacific/EFW/Henshaw, 1999). The D-zone also has an upward hydraulic gradient in relation to C-zone but is separated by a thick deposit of relatively low permeability clay. Tidal influence studies at the Site have determined that the mean water level elevation in the sloughs is 1.30 feet above msl and 1.9 feet above msl in the A-zone (Geomatrix and Papadopoulos, 1992). Thus, there exists a vertical hydraulic gradient from the A-zone toward the sloughs. The estimated groundwater flux between the A-zone and the adjacent sloughs is approximately 1.67 gallons per day (HLA, 1993). Vertical hydraulic gradients may also be affected by tidal fluctuations.

### 2.3 Operation History

Since the mid-1950s, the Site has generally been used to recycle or process chemicals. In 1956, a chemical processing plant was built and used by Hird Chemical Corporation. The Site was transferred to the Carad Chemical Corporation in 1959. In 1963, the Site was purchased by P. D. Electronics, and Romic began operating at the facility. The Site was purchased by Romic in 1979, and Romic operated the facility until the fall of 2007. Activities at the Site include solvent recycling (primarily distillation), fuel blending, wastewater treatment, and hazardous waste storage and transfer (Conor Pacific/EFW/Henshaw, 1999). A Site facility map is included as Figure 2.

Regulatory documents and records kept by Romic between 1963 and 1973 indicate that the Site handled waste paints, degreasing solvents, acrylic resins, thinners, vinyls, inks, light and heavy oils, miscellaneous flammables, and greases (Conor Pacific/EFW/Henshaw, 1999). After 1980, Romic characterized the materials handled at the Site as halogenated hydrocarbons, distillation bottoms, still bottoms, ink sludge, paint sludge, organic chemicals, polymeric coating wastes, and solvents.

One documented release of constituents of concern (COCs) to the environment occurred in 1973. During the winter season of 1972-1973, tidal flooding breached the levees resulting in discharge from the ponds to the sloughs. The RWQCB issued an abatement order on March 23, 1973 (RWQCB, 1973) which estimated a release of approximately 20,000 gallons per day of waste liquids from the former east pond to the adjacent slough. As a result of the abatement order, Romic rebuilt levees, improved surface drainage, and connected the facility to the sanitary sewer. The surface topography provides containment of fluids by sloping towards a central location where storm water was collected and managed under both industrial wastewater discharge and National Pollution Discharge Elimination System (NPDES) permits.

In 1983, the Site handled approximately 4,200,000 gallons of waste materials. As of 1989, the Site processed approximately 7,000,000 gallons of waste materials per year (HLA, 1989). Prior to operation closure in 2007, the Site was handling 35,000 tons of waste material per year. These wastes are byproducts of various industries including the following: chemical, paint, ink, semiconductor, airline, electronics, biotech, printing, and pharmaceutical. Previous releases of waste material have resulted in impacts to the soil and groundwater at the Site. The primary cause of soil and groundwater contamination is through the release of solvent waste material and recycled product in and around the central process areas. Previous releases have occurred as a result of accidental spills, tank and container overfills, flooding events, and breaks in transfer pipes. A trough connecting the central process area, Former Pond Area, and the former wastewater receiving ponds also may have acted as a source of contamination (Figure 2).

The Site ceased operations in 2007 and surface closure activities were completed in 2010. The only above-grade structures that remained after surface closure are the concrete pavement, walls, tank pads and the parking lots. Romic also controls adjacent land to the south which it uses for surplus storage, and adjacent land to the west, which acts as a buffer area. The Site is surfaced

with concrete, except the equipment storage yard and southern parking lot which are surfaced with compacted gravel. Soil berms and levees constructed around the Site remain to prevent surface runoff entering from adjacent properties (HLA, 1989).

## 2.4 Surrounding Land Use History

There are several environmentally impacted areas in close proximity to the Site. Auto-wrecking yards are located immediately south and west of the Site. At these locations, some removal activities have been conducted to address petroleum- and lead-impacted soil (Conor/Pacific/EFW/Henshaw, 1999). Also south of the Site is the former Rhône-Poulenc facility (also known as the Zoecon site) that produced agricultural chemicals for decades (HLA, 1989 and Conor Pacific/EFW/Henshaw, 1999). This facility was remediated to address elevated arsenic concentrations in soil and groundwater (Conor Pacific/EFW/Henshaw, 1999). A Pacific Gas and Electric (PG&E) substation is located close to the Site and could be a source of polychlorinated biphenyls (PCBs).

The former Romic facility is located entirely within the City of East Palo Alto's Ravenswood Business Development (RBD) District. This area is slated for commercial and light industrial development over the next decade, with no residential development allowed east of Pulgas Avenue. The RBD District encompasses approximately 200 acres, including the Four Corners Area (Bay/University Avenue). The Four Corners Area is primarily characterized by a mixture of retail and residential uses. Current use of the RBD District includes a combination of light and heavy industrial companies, wrecking and storage yards, non-conforming residential uses, and undeveloped parcels.

## 2.5 Permitted Units, Solid Waste Management Units, and Other Contaminant Sources

Romic operated over 20 permitted units as part of its operation (Figure 3). At least half of these units were tank farms (some tank farms were compounded into one permitted unit) and the remaining units were comprised of four storage areas, one sampling area, one high temperature unit, one liquefaction unit, and one truck wash. Further detail regarding the specific tanks and former units is presented in the *Draft Facility Closure Plan* submitted to DTSC on April 7, 2008 (Clean Harbors, 2008) and the *Facility Closure Certification Report* (Bureau Veritas 2009) and addendums (Bureau Veritas 2010). The tank farms contained tanks of various sizes associated with the operation of the facility. The tank farms were bermed or walled for containment purposes. Currently, all of the tanks in the tank farms have been removed and there is nothing in the storage areas. The permitted units and a brief description of each unit are summarized below:

- Drum Crusher (north storage building) – This unit is a warehouse that contained one fixed and one mobile drum crushers.
- South Drum Storage Building – This building stored containers of various sizes that held liquids associated with the operation.

- Drum Sampling Area – This unit was 125 feet in length and 74 feet in width. The unit stored containers of various sizes that held liquids associated with the operation.
- Liquefaction Unit – This unit occupied two levels in the drum and debris buildings. Tank PT-1 was part of the liquefaction unit.
- High Temp Unit – This unit had three components: tank HTU and two receiver tanks (HTU-1 and HTU-2). The tanks held a total permitted capacity of 1,931 gallons of liquids associated with the operation.
- Truck Wash Unit – The Truck Wash Unit consisted of a storage tank (TW-1) and a truck wash system. The truck wash system consisted of a four-compartment truck wash skid and a rack that held a sprayer. The Truck Wash Unit secondary containment area measured 73 feet by 27 feet.
- West Storage Building #2 – The buildings that were part of the unit was the field services warehouse, clean product storage area, and scrubber unit.
- Tank farm A – The unit consisted of several tanks that held a total permitted capacity of 75,182 gallons of liquids associated with the operation.
- Tank farm B – The unit consisted of several tanks that held a total permitted capacity of 23,715 gallons of liquids associated with the operation.
- Tank farm CLR – The unit consisted of several tanks that held a total permitted capacity of 54,000 gallons of liquids associated with the operation.
- Tank farm D – The unit consisted of several tanks that held a total permitted capacity of 23,500 gallons of liquids associated with the operation.
- Tank farm E – This unit was planned but never constructed.
- Tank farm F – This unit was planned but never constructed.
- Tank farm G – This unit was not permitted to receive, store, or process hazardous waste.
- Tank farm H – The unit consisted of several tanks that held a total permitted capacity of 105,600 gallons of liquid associated with the operation.
- Tank farm I – The unit consisted of several tanks that held a total permitted capacity of 119,451 gallons of liquids associated with the operation.
- Tank farm J – The unit consisted of several tanks that held a total permitted capacity of 1,740 gallons of liquid associated with the operation.
- Tank farm K – This building stored containers of various sizes that held liquids associated with the operation.
- Tank farm MNO – The unit consisted of several tanks that held a total permitted capacity of 105,600 gallons of liquids associated with the operation.
- Tank farm Q – The containment area for this tank farm was constructed partially below grade. The floor of the containment is approximately 3 to 4 feet below surrounding grade. The unit

consisted of several tanks that held a total permitted capacity of 494,324 gallons of liquid associated with the operation. Fourteen tanks out of the twenty-two tanks that are part of this unit were never permitted to receive, store, or process hazardous waste.

- Tank farm S – This unit was planned but never constructed.
- Tank farm T – This unit was planned but never constructed.
- Tank farm U – This unit was planned but never constructed. It was designed to hold several tanks that would have had a total permitted capacity of 105,600 gallons of liquids associated with the operation.

Twenty different Solid Waste Management Units (SWMUs) were identified during the Resource Conservation and Recovery Act (RCRA) Facility Assessment (California State Department of Health Services Toxic Substances Control Program, 1989). These SWMUs are listed below:

- East Containment Pond
- West Containment Pond
- Waste Discharge Trough
- Historical Drummed Waste Storage Areas
- West Storage Area
- Process Area Sump
- Truck Parking Area
- Drummed Waste Staging Area
- Drum Crushing Area
- South Drum Storage Building
- North Drum Storage Building
- CSR Drum Storage Building
- Bulk Waste Storage Waste Area (Green Tanks)
- Bulk Waste Storage Area (Brown Tanks)
- Centrifuge
- Centrifuge Roll-off Bins
- Administration/Laboratory Building Septic Tank and Drain field
- Process and Sanitary Sewer System and Wastewater Surge Tank
- Surge Tank Separator
- Runoff Sump Separator

In addition to the permitted units and SWMUs, three suspected contaminant source areas have

been identified at the Site. These potential source areas are: the Former Pond Area, and two former drum storage areas (Figure 2).

The Hird Chemical Corporation constructed the original processing facility in the mid- 1950s. At that time, the east and west ponds were constructed in the northern portion of the Site. The ponds collected surface water runoff from the Site and adjacent properties. Wastewater and waste material were also reportedly discharged to the ponds. A wastewater discharge trough was used to transport fluids from the Central Processing Area to the former east pond. An estimated 100,000 gallons per week of wastewater were discharged to these ponds in the early 1970s (HLA, 1989). Overflow from these ponds was transferred to the sloughs via an outfall pipe. In 1973, under the supervision of the United States Army Corps of Engineers, the outfall pipe was decommissioned by sealing it with concrete. Thereafter, wastewater was discharged to the sanitary sewer under a permit from the East Palo Alto Sanitary District. Near the end of the 1970s, the ponds were decommissioned, backfilled with concrete debris, blocks, and backfill material, and capped with concrete. Warehouses were later built on top of the former ponds (Conor Pacific/EFW/Henshaw, 1999).

There were two drum storage areas onsite during early operations. The first drum storage (south of the drum sampling area and Former Pond Area) was on unlined or unpaved surfaces which could have allowed seepage of the drum contents such as contained wastes and reclaimed water to the soil column. The second drum storage area (southwest of the Central Processing Area) was also on unlined or unpaved surfaces. Approximately 1,000 to 1,500 drums could have been present at any one time at the Site. The former drum storage areas were decommissioned and are now covered with pavement (Conor Pacific/EFW/Henshaw, 1999).

Other areas of concern at the Site include the following:

- A wastewater discharge trough moved wastewater from the Central Processing Area to the Former Pond Area. It is unknown if releases have occurred from this trough.
- Process water was treated along the south central boundary of the Site at a treatment unit.
- An area of elevated volatile organic compounds (VOCs) exists in groundwater in the southwestern portion of the Site with no known source.
- The offsite auto-wrecking yards located to the south and west of the Site may be contributing to onsite contamination.

## **2.6 Descriptions of Areas Investigated**

As presented in Section 1.0, areas of the Site were grouped for ease of investigation and reporting. Details regarding each of the areas are presented below.

### *2.6.1 Central Processing Area*

The Central Processing Area encompasses portions of areas described in the CSAP Work Plan. Specifically, the Central Processing Area encompasses the majority of two suspected, historical

contaminant source areas: the former northern drum storage area, and portions of the former southern drum storage area. Additionally, this area includes permitted Tank Areas (or “Farms”) A, B, CLR, H, G, I, J, K, M, N, and O, and the “high temp unit”. The Central Processing Area location is shown on Figure 2.

The former north drum storage area was identified in historical aerial photographs as being located between the Former Pond Area and the Central Processing Area. A small portion of the former south drum storage area was also located within the Central Processing Area between Tank Farms “J” and “K” (Figure 2). At any given time during historical operations, as many as 1,000 to 1,500 drums may have been present in the combined former drum storage areas. The drums reportedly contained reclaimed product and waste. Emptied drums were also stored in this area. The drums in these areas were stored on unlined or unpaved surfaces and drum contents could have been released to the underlying soil.

The Central Processing Area was located in the center of the Site, south of the Former Pond Area. The bulk of the solvent recycling, fuel blending and chemical handling occurred in this area. Several permitted units were located in this area including the high temp unit, and the following Tank Farms; A, B, CLR, D, G, H, I, J, K, and MNO. The tank farms contained tanks of various sizes associated with the operation of the facility. They were either bermed or enclosed by cinderblock secondary containment walls. The total combined tank farms were permitted to hold approximately 510,000 gallons of liquid.

### 2.6.2 Northern Area

The two former liquid waste settling ponds were located across most of the Northern Area prior to 1980. The ponds were located approximately 200 feet south of the northernmost property boundary and extended close to the eastern and western property boundaries (Figure 2). Based on evaluation of available historical aerial photographs, the former ponds were originally wetlands dating back to at least 1941. The ponds were apparently constructed by building broad levees to enclose each pond directly over the existing marsh surface. The contact was discernible in the borings and is approximately eight to ten feet below the current paved surface. Following termination of pond use for waste disposal, the entire area was filled with undocumented fill and debris. This area is now elevated approximately five to eight feet above the remainder of the Site.

This elevated northern portion of the Site was paved over and developed for additional Site operations in approximately 1979. New operations included; a drum crushing area (adjacent to the north storage building), the south drum storage building, the liquefaction area, the drum sampling area and the adjacent drum pumping area. The former north storage building was a warehouse that contained one fixed and one mobile drum crusher. The south drum storage building and the drum sampling area stored containers of various sizes that held liquids associated with Site operations. The liquefaction area was located adjacent to and southeast of the drum sampling area and occupied two levels in a drum and debris building (Figure 2). These

potential contaminant sources were part of the investigation goal for this area. The purpose of the investigation in this area was to delineate the horizontal and vertical boundaries of the former ponds as well as to characterize the material used to fill the ponds.

### 2.6.3 *Truck Wash Area*

The Truck Wash Area was located adjacent and south of the Central Processing Area along the southern property boundary in the area of historic auto wrecking operations. The Truck Wash includes the former water storage tank and the truck wash system with a secondary containment area. The wash system consisted of a four-compartment truck wash skid and rack for spray equipment. The surface of the truck wash and containment area was constructed of reinforced concrete. Two sump drains were located in the low points of the containment area to collect potentially contaminated rinse and wastewater.

### 2.6.4 *Western Area*

The western portion of the Site is located west and southwest of the Central Processing area and consists of Tank farm "Q", the west storage building #2, the west storage lot and facility maintenance building, a portion of the former south drum storage area, and a portion of the former off site auto wrecking yard (Figure 2).

Tank farm "Q" was located immediately west of the central processing area and was approximately 150 feet long and approximately 70 feet wide (Figure X). The elevation of the floor of the tank farm varied from one to four feet below the surrounding grade. The tank farm was enclosed by an approximate three foot high cinderblock secondary containment wall. The tank farm consisted of several tanks that held a total permitted capacity of approximately 494,000 gallons of liquid associated with Site operations. Many of the tank pads in this area were open pads formed with concrete and filled with sand. The open tank pads would have allowed seepage of the tanks contents into the soil column.

The West storage building #2 was formerly located approximately 50 ft. from the western most property line, and adjacent Tank farm "Q" (Figure 2). This area is also within the footprint of the historic auto wrecking yard discussed in detail below. The former building served as a field services warehouse, a clean product storage area, and housed a scrubber unit. The potential for spills or releases from materials stored in this building and the known historic auto wrecking activities that occurred previously in the area are potential contaminant sources.

The west storage lot and facility maintenance building (SWMU #5) were located in the southwest corner of the Site. Truck and facility maintenance were performed inside the former building, while surplus equipment, scrap metal, old drums and other various operational supplies were stored outside and in the surrounding area. The maintenance building and storage lot were also located within the footprint of the historic auto wrecking yard. The potential for spills or releases from the operations in this building and the known historic auto wrecking activities that occurred previously in the area are potential contaminant sources.

The former south drum storage area (AOC #9) was located predominantly in the western portion of the Site, in the area later occupied by the West storage Building #2, and Tank farm "Q". At any given time during operation, as many as 1,000 to 1,500 drums may have been present in this area. The drums consisted of reclaimed product, waste, and empty drums. The drums in this area were stored on unlined or unpaved surfaces which would have allowed seepage of the drum contents into the soil column.

The former auto wrecking yards were located to the south and west of the Site. During Site expansion, the Romic facility acquired these adjacent properties, now located along the southern and western property boundaries. Based on historic operations and auto wrecking yard activities, the potential for impacts to soil and groundwater were investigated in these areas.

#### *2.6.5 Panhandle and Eastern Area*

The Panhandle and Eastern Area encompasses the area directly east of the Central Processing Area and extending south to Bay Road. Included in this area are the former office building, an office and laboratory building, a septic tank (SWMU #3), a runoff sump separator (SWMU # 4), an elevated parking area, and the driveway and adjacent undeveloped land (former area of historic auto wrecking operations). The Panhandle and Eastern Area is shown on Figure 2.

A former office building was located adjacent to the main driveway and was the first building encountered upon entering the site. This building was used for administrative purposes. No known processing or handling of hazardous materials occurred in the building; however, the building was located in the area of historic auto wrecking operations. A former office/laboratory building was located in between the two truck scales, and west of the elevated parking area. Various laboratory chemicals were used in this building during the facilities operation. The potential for release from the laboratory chemicals make this building an area of concern.

The septic tank is located adjacent north of the northern most office building and is discussed further in Section 4.7.

The runoff sump separator is located northeast of the office/laboratory building, at the lowest point of the facility. Rainwater or liquid waste releases would flow to this low point in event of a release. The potential for spills or releases from materials used onsite to enter the soil and groundwater from this low point make this an area of concern.

The area along the northeastern property boundary has always been used as a parking area for personnel vehicles and no known site operations were conducted in this area. This area is not an area of concern.

The driveway from Bay Road to the Site and an area of undeveloped land are located in an area historically used for auto wrecking. Prior to Site expansion, these former auto wrecking areas were located to the south and west of the Site. During Site expansion, the Romic facility acquired these adjacent properties, which now located along the southern and western Site

boundaries. Due to the historic operations and auto wrecking yard activities conducted in the Panhandle and Eastern Area, soil and groundwater in the areas of concern were investigated.

## 2.7 Previous Investigations

Environmental investigations were initiated at the Site in April 1985. These and subsequent investigations were performed to evaluate the nature and extent of chemical compounds in the soil, soil vapor, and groundwater beneath the Site, and to evaluate the Site's geotechnical and hydrogeological conditions, and the effects of tidal cycles on Site hydrogeology. Results of these investigations indicated the soil and groundwater are contaminated primarily with VOCs. However, semi-volatile organic compounds (SVOCs), metals, PCBs, petroleum hydrocarbons (TPH), and mercury have also been detected at the Site. VOCs have been detected in soil vapor. Historical soil test results for VOCs, SVOCs, and metals were presented in Figures 4 and 5, respectively, in the CSAP work plan (Iris 2011a).

In July 1987, HLA conducted a preliminary tidal influence study at the Site. It was determined that the sediments and the slough are connected albeit through very low permeability material (HLA, 1987). An estimated groundwater flux, from the A-zone to the tidal slough, was calculated to be approximately 1.67 gallons per day (HLA, 1991).

Romic implemented a groundwater extraction and treatment system as an interim remedial measure to address VOCs in the A- and B-zones. Beginning in May 1993, groundwater was extracted from six wells in the A-zone, and the extracted groundwater was treated by steam stripping and granular activated carbon. In September 1998, an additional extraction well was installed in the B-zone to extract water from the northern portion of the Central Processing Area.

In January 2001, ARCADIS initiated two enhanced reductive dechlorination (ERD) pilot tests to evaluate the effectiveness of the ERD technology to reduce VOC contaminant mass at the Site. The ERD pilot test was successful, and in 2003, 2005, and 2007, the program was expanded into other areas of the Site as interim remedial measures. In February 2005, upon receipt of USEPA approval, the groundwater extraction and treatment system was shut down due to the success of ERD pilot tests and interim remedial measures.

Historical Site investigations and interim remedial measures are summarized in the *Corrective Measures Study Report* (ARCADIS, 2007).

### 3.0 FIELD AND LABORATORY METHODS

The sections below present the field and laboratory methods used in this investigation.

#### 3.1 Field Methods

Soil, groundwater and soil vapor sampling was conducted at the Site between June 2011 and December 2011. Soil boring permits were obtained from the San Mateo County Environmental Health Services Department. The permits are included in Appendix A. Prior to conducting field activities, Iris Environmental marked boring locations and notified Underground Service Alert (USA). In addition, the proposed drilling locations were assessed for subsurface utilities by Foresite Engineering Survey, Inc. of Pleasant Hill California, a private utility locator.

##### 3.1.1 Soil Borings

Soil borings were advanced by Penecore Drilling, a California C57-licensed drilling company, of Woodland California. 160 Soil borings were advanced using a Geoprobe® 7822 DT direct push drill rig equipped with a dual tube sampling system. Borings were advanced to depths ranging from 0 to 17 feet bgs depending on the specific area of the Site and the surface elevation in each of the investigation areas. The soil boring locations are shown on Figure 3.

As presented in the CSAP, soil boring locations were proposed on a 30 foot by 30 foot grid in the permitted unit areas and a 90 foot by 90 foot grid in the non-permitted unit areas. Due to field constraints, adverse drilling conditions, or buried utilities, some of the soil boring locations and names changed. In addition, some of the soil boring depths also changed. Table 1 presents the proposed versus actual soil boring locations and depths.

Soil cores in acetate liners were collected from each boring and lithology was described by an Iris Environmental geologist under the direct supervision of a California Professional Geologist. The lithologic logs were produced using the Unified Soil Classification System (USCS) as a guide. Lithologic logs for these borings are presented in Attachment B. Organic vapor measurements of the soil core were taking using an organic vapor meter equipped with a photoionization detector (PID) calibrated with 100 parts per million (ppm) isobutylene standard gas. Upon completion of drilling, the borings were grouted to the surrounding surface with Portland cement grout. Drilling and sampling equipment were properly decontaminated prior to each use at each boring location using a combination of high pressure hot water, Alconox™ wash solution and potable water rinse.

In addition to the soil borings advanced using direct push technology, cone penetrometer test (CPT) borings were advanced at three locations in the Panhandle and Eastern Area. CPT soundings were performed by Gregg Insitu, of Martinez, California, using a 25-ton CPT rig. The CPT piezocone measures friction, tip resistance, and pore pressure, which are logged and used to evaluate soil types on a nearly continuous geologic log. The CPT soundings were performed in accordance with American Society for Testing and Materials (ASTM) Standard Test Method for Electronic Friction Cone and Piezocone Penetration Testing of Soils (D 5778-07) (2007).

### 3.1.2 Soil Sampling

Soil Samples were collected for laboratory analysis at approximately 0 to 0.5, 2.5 to 3.0 and 5.5 to 6.0 feet bgs depending on soil and materials encountered during the investigation. Select sampling depths were adjusted in the field based on whether groundwater or gravel fill materials were present in the pre-selected sample depth intervals. The soil samples for VOC analysis were collected from the retrieved acetate liner using a Terra Core™ sampling device and preserved in accordance with USEPA Method 5035. The soil samples were then immediately transferred to methanol-preserved, laboratory supplied glassware and placed on ice. In addition to samples for VOC analysis, soil samples to be analyzed for other compounds and metals were collected in sections of the acetate sleeve, covered with a Teflon sheet, capped with a plastic cap and wrapped with silicone tape. All samples were labeled with a unique sample identifier designating the boring location and depth. Proper chain-of-custody was maintained for the soil samples collected for analytical testing from field collection to receipt by the analytical laboratory.

### 3.1.3 Groundwater Sampling

Groundwater samples were collected in the Panhandle and Eastern Areas in accordance with the CSAP work plan using two different methods. Six grab groundwater samples were collected from first encountered groundwater using temporary 1-inch diameter temporary polyvinyl chloride (PVC) wells set in soil borings advanced into the A-zone water-bearing unit. Nine additional grab groundwater samples were collected from cone penetrometer test (CPT) borings using the Hydropunch™ methods in the A, B, and C-zone water bearing units at locations along the Site boundary with the Infinity Salvage property (Figure 3) to evaluate the presence of VOCs in groundwater in that area of the Site. The samples were collected at depths selected from CPT data to assess conditions in the A-, B-, and C-zone water bearing units.

Five of the shallow grab groundwater sample locations were located in the undeveloped area in the southeastern portion of the Site. The remaining grab groundwater sample was collected at soil boring location R25. These grab groundwater samples were collected by placing a temporary 1-inch PVC well casing and 0.01-inch slot screen into the borehole once the target depth has been reached. The water column was allowed to stabilize for at least 30 minutes prior to sample collection. Grab groundwater samples were collected using either a pre-cleaned disposable bailer or an inertia check-ball pump. Once the grab groundwater sample was collected, the PVC casing was removed and the borehole abandoned as previously described.

HydroPunch™ technology was used to collect depth-specific groundwater samples from targeted permeable intervals based on the CPT results. To collect water samples, the CPT rig was used to hydraulically advance 1¾-inch diameter, hollow push rods to the bottom of the desired sampling interval. The push rods were retracted, exposing a screen and allowing groundwater to infiltrate hydrostatically from the formation into the screen. A small-diameter bailer was then lowered through the push rods into the screen section for sample collection. Upon filling, the bailer was

retrieved and the groundwater decanted into the appropriate laboratory-supplied sample containers. Upon completion of sample collection, the equipment was decontaminated. Boreholes were grouted with neat cement grout from the bottom up using the HydroPunch rods as tremie pipe.

Sample containers from both groundwater sampling efforts were labeled and stored in an ice-filled cooler chilled to 4°C. The samples were couriered to the laboratory for chemical analysis under proper chain-of-custody protocol.

### 3.1.4 Soil Vapor Sampling

Soil vapor samples were collected adjacent to mapped subsurface utility corridors at locations beyond areas considered as impacted by VOCs after completing the soil sampling phase of the CSAP program (Figure 4). Soil vapor samples were collected in accordance with the CSAP and procedures outlined in the Los Angeles RWQCB *Interim Guidance for Active Soil Gas Investigation* (1997); the *Advisory - Active Soil Gas Investigations*, jointly issued by Los Angeles RWQCB and DTSC (2003); and the *Interim Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air* (DTSC, 2005).

All soil vapor samples were collected from temporary implants installed in borings following the procedures presented below. Samples collected at each location were tested for VOCs by USEPA Method 8260B using an onsite mobile laboratory. In accordance with the CSAP work plan, ten percent of the soil vapor samples were submitted as duplicates to a fixed laboratory for confirmatory testing using USEPA Method TO-15.

One temporary soil vapor sampling implant was installed in each boring drilled using the direct-push drill rig. The implants were constructed as follows: Drill rods were advanced to a total depth of approximately 5 feet bgs, and then slightly retracted, leaving an open boring interval. If groundwater was present in the boring, the implant was installed at a shallower depth above groundwater. Using a Tremie pipe as necessary, inert disposable Nylaflow™ tubing with an outer diameter of 0.125 inches and an attached microfilter sampling tip were installed in the boring at the target depth. Following installation of the sampling line, a one-foot thick annular sand-pack was placed around the sampling tip. One foot of dry granular bentonite was then placed above the sand, followed by hydrated granular bentonite up to the ground surface.

Each sampling line was labeled and finished at the surface with an in-line clamp and three-way valve. The in-line valve or clamp was kept in place at all times while not sampling to prevent the backflow of ambient air into the sampling line between purges and prior to sampling. To allow subsurface conditions to equilibrate, no further procedures were conducted for approximately 30 minutes. Soil vapor sampling was not conducted during or immediately after any significant rain events (e.g., ½ inch or greater).

Samples were collected for analysis in an onsite mobile laboratory by Transglobal Geochemistry (TEG), of Sacramento, a California certified mobile laboratory. Samples were collected in sealable 50 cubic centimeter single-use syringes for immediate transport to the mobile laboratory

and injection for analysis into the mobile laboratory analytical equipment. The flow rate during purging and sampling was moderated by the sampler to between 100 and 200 milliliters per minute (mL/min) to limit stripping of chemical compounds, to prevent ambient air from diluting the soil gas samples, and to reduce the variability of sampling rates. Sample syringes were new and only used for the collection of one sample to prevent cross-contamination between samples. Other sampling equipment that had the potential to come into contact with the soil gas (such as the Teflon tubing) was also used only at a single location and then contained for proper disposal. Reusable sampling equipment such as direct-push drive rods and soil samplers, were decontaminated between borings using an Alconox™ wash solution and potable water rinse.

During soil vapor sampling, a leak detection gas [1,1-difluorethane (1,1-DFA, also known as Freon 152), as found in standard keyboard cleaner] was used to saturate a rag inside a Ziploc bag, which was then placed over the ground surface at the borehole as a leak detection compound to confirm that the sample train and surface seal were tight and leak free. In addition, “puffs” of 1,1-DFA were sprayed in the vicinity of the sampling train during sampling for the same purpose. This leak check test was conducted in accordance with DTSC guidance documents, and was conducted at each individual soil gas sampling location. The detection limit for analyses for the leak check compound was 10 micrograms per liter (µg/L) in accordance with DTSC guidance. Analyses for 1,1-DFA were conducted by the mobile laboratory using USEPA Method 8260B.

Following completion of the soil gas sampling, and after the laboratory had confirmed a successful analysis of the sample, sampling implants were abandoned in place by removing the small diameter tubing from the boring and hydrating the bentonite seal.

#### 3.1.4.1 Purge Volume Tests

Prior to sample collection and following the equilibration period for the selected boring, a purge volume test was performed to establish an optimal purge volume for the remainder of the boring. To perform the purge volume test, the volume of each sampling train, including the annular space of the sand-pack, was calculated to determine a single purge volume. Following equilibration, a syringe was used to purge the sampling train. Consistent with DTSC guidance documents, the purge volume yielding the highest analytical results would be used as the appropriate number of volumes purged during subsequent sampling. Samples were collected for analysis following the purging of one, three, and seven volumes of vapor from the sampling train. Each of these samples was analyzed in the TEG mobile laboratory. Based on the lack of detectable VOCs in any of the purge samples, the three volume purge was selected for all subsequent sampling.

Duplicate samples for fixed laboratory analysis were collected in a 1-liter Summa canister through a dedicated flow controller and an integral 0.7 micron filter was attached to the purged sampling train using Teflon™ tubing and Swagelok™ connectors. During sampling, the sampling flow rate was modulated by the flow controller to between 100 and 200 mL/min as

previously described.

Upon completion of the sampling, as determined when the Summa canister reached the target vacuum pressure (approximately five millimeters Hg vacuum), the Summa canister was sealed and the flow controller was removed and set aside; each flow controller was used only once to minimize the chance for cross contamination between sample locations. Each Summa canister was then labeled and shipped under proper chain-of-custody protocols to Air Toxics LTD, Folsom, California; a California-certified laboratory. Summa canisters were transported at ambient temperature.

## 3.2 Laboratory Methods

### 3.2.1 Soil and Groundwater

Soil and groundwater samples were submitted under strict chain of custody to Accutest Laboratories, Inc. (Accutest) of San Jose, California; a California-certified analytical laboratory. Samples were analyzed for all or a combination of the following analyses based on their location and observations made in the field.

- VOCs using USEPA Method 8260;
- Semi-volatile organic compounds (SVOCs) using USEPA Method 8270;
- Tittle 22 metals (total metals for groundwater samples) using USEPA Methods 6010B and 7471A (mercury);
- Gasoline range organic (GRO, C<sub>6</sub>-C<sub>10</sub>) using USEPA Method 8015 modified;
- Diesel range organics (DRO, C<sub>10</sub>-C<sub>28</sub>) and motor oil range organics (MORO, C<sub>28</sub>-C<sub>40</sub>) using USEPA Method 8015 modified, following silica gel preparation using USEPA Method 3630C;
- Pesticides using USEPA Method 8081A; and
- Polychlorinated biphenyls (PCBs) using USEPA Method 8082.

Naphthalene was reported by the laboratory using EPA method 8260 and EPA Method 8270. Results from the 8260 analysis method generally indicated higher concentrations than the 8270C analysis. For the purposes of this report, the method 8260 concentrations for naphthalene are discussed in the results section of this report. The 8270C method naphthalene results are not discussed in their respective results section, but are included in the laboratory analytical reports. Both 8260 and 8270 naphthalene results are presented in Tables 2, 5, 8, and 11.

### 3.2.2 Soil Vapor

Soil vapor samples were analyzed on Site in a mobile laboratory and duplicate confirmatory samples were submitted to a fixed laboratory. All samples were managed under proper chain-of-custody protocol.

Onsite analyses were performed by TEG using USEPA Method 8260B. Soil vapor analytical results from the onsite laboratory are presented in Table 14.

Samples collected for fixed laboratory testing were submitted to Air Toxics LTD, for confirmatory testing using USEPA Method TO-15. Soil vapor analytical results from the fixed laboratory are presented in Table 15.

## **4.0 RESULTS**

This section presents an overview of the physical observations made during the Site investigation activities. Investigation activities and soil results are then presented for each of the study areas. Soil vapor results are discussed at the end of this section. The chemical concentrations are compared to the project specific RBTC's, if established for the chemical. If an RBTC was not established for a chemical, the concentrations are compared to the Regional Screening Levels (RSLs) or California Human Health Screening Levels (CHHSLs), if available. The soil analytical data is presented in Tables 2 through 7 and groundwater analytical data is presented in Tables 8 through 13. Soil Vapor results are presented in Tables 14 and 15. Copies of the laboratory analytical reports and sample chain-of-custody documentation are presented in Appendix D.

Since groundwater samples were only collected from the Panhandle and Eastern Area of the Site, these results are discussed in Section 8.0.

### **4.1 Physical Observations, Geology and Hydrogeology**

This section describes the general physical observations, geology, and hydrogeology at the Site. More detailed information is presented in the area specific sections below (Sections 4.2, 4.3, 4.4, 4.5, 4.6 and 4.7)

The Site is primarily covered in concrete in the Northern, Central Processing, Western, and Truck Wash Areas of the Site. The Panhandle and Eastern Area is primarily covered in concrete and asphalt, with a portion of undeveloped grassland. Elevations across the Site range from approximately 5 to 11 feet above msl, with the Northern and Eastern portions of the Site having the highest elevations. The lowest portion of the Site is the Central Processing Area. Stormwater typically flows inward toward the central portion of the Site.

Below some areas of concrete and asphalt cover, the Site is occasionally underlain by sand and gravel fill. The fill thickness is greatest in the Central Processing Area and the Northern Area, where it is up to five feet thick. The fill material is underlain by silt, silty sand, and sand to the total explored depth of 8 feet bgs in the Western, Central Processing, Panhandle and Eastern, and Truck Wash Areas.

In the Northern Area, the fill is composed of soil, containing a wide mixture of gravel, wood fragments, plastic, concrete, paint waste, and residual chemicals to approximately 11 feet below ground surface. These fill units are underlain by native Bay Mud to the total explored depth of approximately 17 feet bgs. However, no obstructions were encountered during drilling, except in borings D22, I17 and B23.

Groundwater was not encountered in the borings advanced in the Truck Wash, and the Panhandle and Eastern Areas. However, groundwater was encountered in the borings advanced in the Western Area and Central Processing Area at approximately six to seven feet bgs. Groundwater was also encountered in the borings advanced in the Northern Area at depths varying from six to ten feet bgs.

## 4.2 Central Processing Area

This section describes the results of the investigation conducted in the Central Processing Area of the Site.

### 4.2.1 Activities Performed

Investigative activities conducted in the north and south drum storage area and the Central Processing Area of the Site included the drilling and sampling of 45 borings. In general, the borings were located in the estimated locations of the former drum storage areas, as well as in and around each of the permitted tank farms (Figure 3).

### 4.2.2 Deviations from the CSAP

Field activities were conducted in accordance with the procedures presented in the CSAP, except for the following deviations:

- Sample depths for the 45 borings were adjusted plus or minus 0.5 to 1.0 feet based on field observations, shallow groundwater, and obstructions encountered during drilling operations.
- A test trench was not excavated in the suspected location of the former trough since nearby soil boring data indicated the area was chemically impacted.

### 4.2.3 Field Observations

During the advancement of the 45 soil borings, field notes and lithologic logs were prepared to document physical conditions of the soil and other materials encountered. In general, the area is covered in concrete and the concrete thickness varied from approximately four inches to 16 inches. Gravel fill was encountered below the concrete and ranged from one to 40 inches thick. Soil, consisting of silts, fine to coarse grained sands and silty sands, were encountered below the gravel fill to the total explored depth of approximately 8.0 feet. Strong odors were observed from approximately two to eight feet bgs. Groundwater was not encountered in every boring advanced; however, groundwater was encountered in some borings at approximately six feet bgs.

### 4.2.4 Soil Analytical Data

A total of 117 samples (112 primary and five duplicates) were collected from the 45 borings drilled in the Central Processing Area. Tables 2 through 7 present the concentrations of VOCs, petroleum hydrocarbons, SVOCs, metals, pesticides and PCBs in soils. The laboratory analytical results and sample chain-of-custody records are presented in Appendix D. The results from the soil sampling are summarized below, relative to respective RBTCs, RSLs, or CHHSLs.

The soil sampling laboratory analytical results are discussed below.

#### 4.2.4.1 Petroleum Hydrocarbons

The concentrations of petroleum hydrocarbons detected during this investigation are presented below. RBTCs were not developed for petroleum hydrocarbons.

- GRO was detected in a total of 21 samples (20 primary and one duplicate sample). Concentrations ranged from 0.125 mg/kg to 7,670 mg/kg, with the maximum concentration detected in soil boring R19 at 1.5 feet bgs.
- DRO was detected in 20 samples. Concentrations ranged from 6.11 mg/kg to 15,800 mg/kg, with the maximum concentration detected in soil boring L20 at 0.7 feet bgs.
- MORO was detected in 13 samples. Concentrations ranged from 16.9 mg/kg to 12,300 mg/kg, with the maximum concentration detected in soil boring L20 at 0.7 feet bgs.

#### 4.2.4.2 Volatile Organic Compounds

The concentrations of VOCs detected during this investigation are presented below by chemical. A total of 29 chemical constituents were detected in the samples submitted for laboratory analysis and 18 of those constituents were detected above their respective RBTC. A total of 38 chemical constituents were not detected above laboratory method detection limits in the samples submitted for laboratory analysis.

- Benzene was detected in a total of 50 soil samples. Benzene exceeded the RBTC of 0.013 mg/kg in 32 samples. Detected concentrations above the RBTC ranged from 0.0144 mg/kg to 7.01 mg/kg, with the maximum concentration detected in soil boring S19 at 7.3 feet bgs.
- Chloroform was detected in a total of 13 soil samples. Chloroform exceeded the RBTC of 0.0029 mg/kg in 11 samples. Detected concentrations above the RBTC ranged from 0.0109 mg/kg to 4.84 mg/kg, with the maximum concentration detected in soil boring T18 at 3.1 feet bgs.
- 1, 4-Dichlorobenzene was detected in a total of six soil samples. 1, 4-Dichlorobenzene exceeded the RBTC of 0.05 mg/kg in five samples. Detected concentrations above the RBTC ranged from 0.152 mg/kg to 1.35 mg/kg, with the maximum concentration detected found in soil boring K21 at 3.0 feet bgs.
- 1, 1-DCA (DCA) was detected in a total of 53 soil samples. 1, 1-DCA exceeded the RBTC of 0.028 mg/kg in 32 samples and one duplicate sample. Detected concentrations above the RBTC ranged from 0.0669 mg/kg to 20.8 mg/kg, with the maximum concentration detected in soil boring R17 at 0.8 feet bgs.
- 1, 2-dichloroethane (DCA) was detected in a total of 13 samples above the RBTC of 0.0088 mg/kg. Detected concentrations above the RBTC ranged from 0.102 mg/kg to 86.1 mg/kg, with the maximum concentration detected in soil boring Q20 at 1.1 feet bgs.

- 1, 1-dichloroethene (DCE) was detected in a total of 16 soil samples. 1, 1-DCE exceeded the RBTC of 0.9 mg/kg in seven samples. Detected concentrations above the RBTC ranged from 1.2 mg/kg to 7.93 mg/kg, with the maximum concentration detected in soil boring K21 at 3.0 feet bgs.
- Ethylbenzene was detected in a total of 87 soil samples. Ethylbenzene exceeded the RBTC of 0.075 mg/kg in 78 samples (74 primary and four duplicate samples). Detected concentrations above the RBTC ranged from 0.0987 mg/kg to 279 mg/kg, with the maximum concentration detected in soil boring Q20 at 1.1 feet bgs.
- Methylene chloride was detected in a total of 18 soil samples. Methylene chloride exceeded the RBTC of 0.14 mg/kg in 15 samples. Detected concentrations above the RBTC ranged from 0.333 mg/kg to 422 mg/kg, with the maximum concentration detected in soil boring N21 at 1.0 feet bgs.
- Naphthalene was detected in a total of 56 soil samples. Naphthalene exceeded the RBTC of 0.35 mg/kg in 42 samples (40 primary and two duplicate samples). Detected concentrations above the RBTC ranged from 0.424 mg/kg to 50.8 mg/kg, with the maximum concentration detected in soil boring Q20 at 1.1 feet bgs.
- 1, 1, 2, 2- Tetrachloroethane (TCA) was detected in a total of three samples above the RBTC of 0.021 mg/kg. Detected concentrations above the RBTC ranged from 1.32 mg/kg to 23 mg/kg, with the maximum concentration detected in soil boring T21 at 3.0 feet bgs.
- Tetrachloroethene (PCE) was detected in a total of 48 soil samples. PCE exceeded the RBTC of 0.0048 mg/kg in 45 samples (43 primary and two duplicate samples). Detected concentrations above the RBTC ranged from 0.0059 mg/kg to 483 mg/kg, with the maximum concentration detected in soil boring T18 at 3.1 feet bgs.
- Toluene was detected in a total of 89 soil samples. Toluene exceeded the RBTC of 220 mg/kg in 19 samples (18 primary and one duplicate sample). Detected concentrations above the RBTC ranged from 227 mg/kg to 1,120 mg/kg, with the maximum concentration detected in soil boring Q20 at 1.1 feet bgs.
- 1, 1, 1-Trichloroethane (TCA) was detected in a total of 32 soil samples. 1, 1, 1-TCA exceeded the RBTC of 35 mg/kg in six samples. Detected concentrations above the RBTC ranged from 45.3 mg/kg to 307 mg/kg, with the maximum concentration detected in soil boring N21 at 1.0 feet bgs.
- 1, 1, 2-TCA was detected in a total of four primary samples above the RBTC of 0.026 mg/kg. Detected concentrations above the RBTC ranged from 0.191 mg/kg to 6.89J mg/kg, with the estimated maximum concentration detected in soil boring Q17 at 1.9 feet bgs.

- Trichloroethene (TCE) was detected in a total of 40 soil samples. TCE exceeded the RBTC of 0.018 mg/kg in 34 samples (33 primary and one duplicate sample). Detected concentrations above the RBTC ranged from 0.0509 mg/kg to 468 mg/kg, with the maximum concentration detected in soil boring R20 at 1.7 feet bgs.
- 1, 2, 4,-Trimethylbenzene was detected in a total of 79 soil samples. 1, 2, 4,-Trimethylbenzene exceeded the RBTC of 0.085 mg/kg in 62 samples (58 primary and four duplicate samples). Detected concentrations above the RBTC ranged from 1.02 mg/kg to 438 mg/kg, with the maximum concentration detected in soil boring Q20 at 1.1 feet bgs.
- Vinyl chloride was detected in a total of 28 soil samples. Vinyl chloride exceeded the RBTC of 0.0025 mg/kg in 25 samples. Detected concentrations above the RBTC ranged from 0.0029 mg/kg to 7.41J mg/kg, with the estimated maximum concentration detected in soil boring T21 at 3.0 feet bgs.
- Xylenes were detected in a total of 88 soil samples. Xylenes exceeded the RBTC of 8.9 mg/kg in 56 samples (53 primary and three duplicate samples). Detected concentrations above the RBTC ranged from 11.4 mg/kg to 1,580 mg/kg, with the maximum concentration detected in soil boring Q20 at 1.1 feet bgs.
- Bromodichloromethane was detected in three soil samples. Concentrations ranged from 0.0012 mg/kg to 13.2J mg/kg, with the estimated maximum concentration detected in soil boring Q17 at 4.4 feet bgs. An RBTC was not developed for this chemical; however, one sample collected from Q17 at 4.4 feet bgs was above the industrial soil RSL of 1.4 mg/kg.
- tert-Butyl alcohol (TBA) was detected in a total of 18 samples. Concentrations ranged from 0.0186 mg/kg to 0.83J mg/kg, with the estimated maximum concentration detected in soil boring K20 at 6.0 feet bgs. An RBTC was not developed to for this compound. Currently there is neither an RSL nor a CHHSL currently established for this compound.
- n-Butylbenzene was detected in a total of 39 soil samples (36 primary and three duplicate samples). Concentrations ranged from 0.0026 mg/kg to 39.9 mg/kg, with the maximum concentration detected in soil boring R17 at 0.8 feet bgs. An RBTC was not developed for this compound; however, the reported concentrations are below the USEPA industrial soil RSL of 5,100 mg/kg.
- sec-Butylbenzene was detected in a total of 30 soil samples (28 primary and two duplicate samples). Concentrations ranged from 0.002 mg/kg to 14.3J mg/kg, with the estimated maximum concentration detected in soil boring R17 at 0.8 feet bgs. An RBTC was not developed for sec-Butylbenzene. Currently there is neither an RSL nor a CHHSL established for this compound.

- tert-Butylbenzene was detected in one sample at a concentration of 0.105 mg/kg. An RBTC was not developed to compare to this detection. Currently there is neither an RSL nor a CHHSL established for this compound.
- Cymene was detected in a total of 36 soil samples (34 primary and two duplicate samples). Concentrations ranged 0.0027 mg/kg to 27.2J mg/kg, with the estimated maximum concentration detected in soil boring Q20 at 1.1 feet bgs. An RBTC was not developed to compare to these detections. Currently there is neither an RSL nor a CHHSL established for this compound.
- 1, 3-Dichlorobenzene was detected in a total of four samples. Concentrations ranged from 0.0316 mg/kg to 0.3J mg/kg, with the estimated maximum concentration detected in soil boring K21 at 0.5 feet bgs. . Currently there is neither an RSL nor a CHHSL established for this compound.
- Dichlorodifluoromethane was detected in one sample. The reported concentration was 0.008 mg/kg. An RBTC was not developed for this compound. However, the reported concentration is below the USEPA industrial soil RSL of 400 mg/kg.
- Di-isopropyl Ether was detected in a total of five samples. Concentrations ranged from 0.0016 mg/kg to 0.0043 mg/kg, with the maximum concentration detected in soil boring Q20 at 6.6 feet bgs. An RBTC was not developed for this compound; however, the reported concentrations are below the USEPA industrial soil RSL of 10,000 mg/kg.
- n-Propylbenzene was detected in a total of 54 soil samples (50 primary and four duplicate samples). Concentrations ranged from 0.002 mg/kg to 49.3 mg/kg, with the maximum concentration detected in soil boring S19 at 7.3 feet bgs. An RBTC was not developed for this compound. Currently there is neither an RSL nor a CHHSL established for this constituent.
- 1, 2, 3-Trichloropropane was detected in two samples. The reported concentrations were 0.0014 mg/kg and 0.0031J mg/kg, with the estimated maximum concentration detected in soil boring V19 at 3.1 feet bgs. An RBTC was not established for this compound; however, the reported concentrations are below the USEPA industrial soil RSL of 0.095 mg/kg.

#### 4.2.4.3 Semi-Volatile Organic Compounds

The concentrations of SVOCs detected during this investigation are presented below by chemical. A total nine chemical constituents were detected in the samples submitted for laboratory analysis. One of those constituents were detected above their respective RBTC. A total of 62 chemical constituents were not detected above laboratory method detection limits in the samples submitted for laboratory analysis.

- Bis (2-ethylhexyl) phthalate was detected in a total of 13 soil samples. Bis (2-ethylhexyl) phthalate exceeded the RBTC of 140 mg/kg in one primary sample. The exceeding concentration was 176 mg/kg, detected in soil boring L20 at 0.7 feet bgs.
- Azobenzene was detected in one sample at an estimated concentration of 0.175J mg/kg, in soil boring R19 at 1.5 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 23 mg/kg.
- Benzoic Acid was detected in one soil sample at a concentration of 2.03 mg/kg in soil boring N17 at 2.0 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 2,500,000 mg/kg.
- Carbozle was detected in one primary soil sample at a concentration of 0.528 mg/kg, in soil boring R19 at 1.5 feet bgs. An RBTC was not established for this chemical. Currently there is neither an RSL nor a CHHSL established for this constituent.
- 2, 4-Dichlorophenol was detected in one soil sample at a concentration of 0.536 mg/kg, in soil boring R19 at 1.5 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 1,800 mg/kg.
- 2, 4-Dimethylphenol was detected in a total of two samples at concentrations of 0.617 mg/kg and 7.56J mg/kg, with the estimated maximum concentration detected in soil boring L20 at 0.7 feet bgs. An RBTC was not established for this constituent; however, the reported concentrations are below the USEPA industrial soil RSL of 12,000 mg/kg.
- Di-n-octyl phthalate was detected in a total of seven samples. Concentrations ranged from 0.139 mg/kg to 10.3 mg/kg, with the maximum concentration detected in soil boring K19 at 1.0 feet bgs. An RBTC was not established for this compound. Currently there is neither an RSL nor a CHHSL established for this constituent.
- 1-Methylnaphthalene was detected in a total of two samples. Concentrations detected were 0.26 mg/kg and 0.522 mg/kg, with the maximum concentration detected in soil boring R19 at 1.5 feet bgs. An RBTC was not established for this constituent; however, the reported concentrations are below the USEPA industrial soil RSL of 99 mg/kg.
- 2, 4, 6-Trichlorophenol was detected in one soil sample at an estimated concentration 0.189J mg/kg, in soil boring R19 at 1.5 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 160 mg/kg.

#### 4.2.4.4 Metals

The concentrations of metals detected during this investigation at or above their respective RBTC or background concentrations are presented below by detected metal. A total of three metals

were detected in the samples submitted for laboratory analysis. Three of those metals were detected above their respective RBTC or background concentration. A total of 13 metals were not detected above laboratory method detection limits in the samples submitted for laboratory analysis.

- Arsenic was detected in a total of 11 soil samples. Arsenic exceeded the calculated background concentration of 16.6 mg/kg in one primary sample. The detected concentration was 23.9 mg/kg, detected in soil boring V19 at 0.6 feet bgs.
- Lead was detected in a total of 19 samples and one duplicate soil samples. Lead exceeded the RBTC of 320 mg/kg in three primary samples. Concentrations ranged from 1,700 mg/kg to 16,600 mg/kg, with the maximum concentration detected in soil boring M19 at 0.5 feet bgs.
- Mercury was detected in a total of 18 soil samples. Mercury exceeded the RBTC of 0.0043 mg/kg in 17 primary samples and one duplicate sample. Concentrations ranged from 0.037mg/kg to 91.6 mg/kg, with the maximum concentration detected in soil boring U21 at 0.5 feet bgs.

#### 4.2.4.5 Pesticides and Polychlorinated Biphenyls

The concentrations of PCBs detected during this investigation are presented below. One pesticide and three PCBs were detected. The pesticide detection was below the RBTC and the three PCB constituents were detected above their respective RBTC.

- Aroclor-1254 was detected in a total of 13 soil samples. Aroclor-1254 exceeded the RBTC of 0.83 mg/kg in five samples. Concentrations ranged from 1.77 mg/kg to 44.1J mg/kg, with the estimated maximum concentration detected in soil boring L20 at 0.7 feet bgs.
- Aroclor-1248 was detected in a total of seven samples. Aroclor-1254 exceeded the RBTC of 0.83 mg/kg in five samples. Concentrations ranged from 0.88 mg/kg to 100 mg/kg, with the maximum concentration detected in soil boring L20 at 0.7 feet bgs.
- Aroclor-1260 was detected in a total of 12 samples. Aroclor-1260 exceeded the RBTC of 0.83 mg/kg in five samples. Concentrations ranged from 1.12 mg/kg to 16.6 mg/kg, with the maximum concentration detected in soil boring L20 at 0.7 feet bgs.

#### *4.2.5 Results Summary*

A subsurface investigation was performed in the Central Processing Area to investigate potential releases from chemicals stored or processed in this area. Most of the former northern drum storage area, a portion of the former south drum storage area, permitted Tank Farms A, B, CLR, H, G, I, J, K, M, N, and O, and the high temp unit were investigated in accordance with the CSAP. The investigation locations in the former drum storage areas were chosen based on the historic placement of drums on unlined or unpaved surfaces and the potential for the contents of the

drums to be released directly to soil. Historical operations in the Central Processing Area included solvent recycling, fuel blending, bulk chemical handling and chemical storage. Chemicals, if released in these areas, would also likely be found inside the secondary containment units, at and around the low spots.

Soil results in the northern and a portion of the southern Central Processing Area (former north drum storage area and a portion of the south drum storage area) indicate impacts of chemicals throughout the soil column at all depths sampled (shallow, medium and deep sample depths). The predominant constituents detected included, but are not limited to: benzene, ethylbenzene, xylenes, PCE, TCE, PCBs and vinyl chloride. The presence of a range of elevated VOC concentrations is consistent with the history of use in this area.

Soil analytical results in the center of the Central Processing Area (tank farms and high temp unit) indicate chemical impacts in the shallow and medium depth samples collected. The predominant constituents detected included, but are not limited to; ethylbenzene, naphthalene, PCE, TCE, vinyl chlorides and xylenes. The presence of a range of elevated VOC concentrations is consistent with the history of use in this area.

Soil results in the southernmost end and the eastern perimeter of the Central Processing Area indicate little to no impacts to soil. The soil condition in these areas is consistent with the lack of chemical handling and facility processes in these areas.

Soil results throughout the Central Processing Area indicated elevated metal impacts in the shallow soil (ground surface to 3.0 feet bgs). The only metals detected above their respective screening criteria (calculated background value or RBTC) were arsenic, lead, and mercury. Arsenic detected above background and lead detected above its respective RBTC may indicate that these constituents were associated with chemical handling and storage in the Central Processing Areas and subsequently released to soil. Mercury detections may represent either a background metal of concern due to the low calculated RBTC, or may be due to past releases.

Based on the detected concentrations of TPHs, VOCs, PCBs and metals, during this investigation, Site soil data indicate releases have occurred in the historically active chemical process and storage portions of the Central Processing Area; however, data suggest that the southern area had little to no impacts.

### **4.3 Northern Area**

This section describes the results of the investigation conducted in the Northern Area of the Site.

#### *4.3.1 Activities Performed*

As described in the CSAP, four investigation test pits were originally proposed in the Northern Area, within the former Pond Areas. However, upon review of initial soil borings drilled around this area, Iris Environmental concluded that test pits would not provide adequate data for assessing conditions in the former Pond Areas. An alternate approach consisting of an additional

26 soil borings was conducted in accordance with the *Revised Addendum to Comprehensive Site-Wide Sampling and Analysis Plan*, (Iris Environmental, 2011c).

#### 4.3.2 *Field Observations*

Investigative activities conducted in the Northern Area included drilling and sampling 39 borings. The borings were advanced on a uniform grid across the Northern Area, with the exception of the eastern edge where groundwater remediation injection and monitoring wells are located (Figure 3). Multiple borings were advanced to 15 feet bgs to confirm the Bay Mud contact.

The lithology in the Northern Area consists of approximately 5 to 12 inches of concrete, underlain by approximately 1 to 3 feet of sand and gravel fill material. From approximately 3 to 10 feet bgs, soil with debris, including concrete, brick, plastic wastes, paint wastes and chemical sludge were encountered. Bay Mud underlies the waste to the total depth explored.

The waste debris materials were encountered beneath the following areas; the former drum sampling area, the former drum crusher area, the former south drum storage building, the drum pumping area and the liquefaction area. Based on historic aerial photographs this is approximately the same area where the ponds were previously located.

Two cross sectional diagrams were developed for the Northern Area to illustrate the approximate depths and location of the fill material encountered during the investigation (Figure 5). Cross Section A-A' (Figure 6) extends from the southern retaining wall of the former drum sampling area, across the northern fence line, and to an unnamed slough. Cross Section B-B' (Figure 7) was drawn from soil boring G18 to soil boring H24.

The waste materials were encountered between 3 and 10 feet bgs. The approximate depths of the various fill materials encountered are shown in cross sections A-A' and B-B'. Based on the locations and depths of fill material encountered during this investigation, the former ponds may have extended horizontally to the north, east and western property boundaries, and were formerly located approximately 10 to 17 feet below the paved surface. Minimally to non-impacted fill material was encountered predominately along the perimeter of the Site boundary, while the majority of the waste fill and debris materials were encountered in the area of the former ponds.

#### 4.3.3 *Deviations from the CSAP*

Field activities were conducted in accordance with the procedures presented in the CSAP, except for the following deviations:

- Sample depths for the 39 borings were adjusted plus or minus 0.5 to 1.0 feet based on field observations, presence of shallow groundwater, fill materials, and obstructions encountered during drilling operations. The actual sample depths are presented on Table 1;

- Multiple soil borings were advanced in lieu of excavating four test pits to evaluate the Former Pond Area, as discussed above.

#### 4.3.4 *Soil Analytical Data*

A total of 128 samples (112 primary and 16 duplicate) were collected from the 39 borings drilled in the former Pond Area and northern portion of the Site. Tables 2 through 7 present the concentrations of VOCs, petroleum hydrocarbons, SVOCs, metals, pesticides and PCBs in soil. The results from the soil sampling are summarized below, relative to their respective RBTCs, RSLs, or CHHSLs.

##### 4.3.4.1 Petroleum Hydrocarbons

The concentrations of petroleum hydrocarbons detected during this investigation are presented below. RBTCs were not developed for petroleum hydrocarbons.

- GRO was detected in a total of 22 soil samples (20 primary and two duplicates). Concentrations ranged from 0.0538 mg/kg to 17,400 mg/kg, with the maximum concentration detected in soil boring H20 at a depth of 7.0 feet bgs.
- DRO was detected in a total of 24 soil samples (22 primary and two duplicate). Concentrations ranged from 10.1 mg/kg to 25,600 mg/kg with the maximum concentration detected in soil boring H20 at a depth of 7.0 feet bgs.
- MORO was detected in a total of 24 soil samples (22 primary and two duplicate). Concentrations ranged from 14.9 mg/kg to 15,500 mg/kg with the maximum concentration detected in soil boring H20 at 7.0 feet bgs.

##### 4.3.4.2 Volatile Organic Compounds

The concentrations of VOCs detected during this investigation are presented below by chemical. A total of 31 chemical constituents were detected in the samples submitted for laboratory analysis. 24 of those constituents were detected above their respective RBTC. A total of 28 chemical constituents were not detected above laboratory method detection limits in the samples submitted for laboratory analysis.

- Benzene was detected in a total of 27 soil samples. Benzene exceeded the RBTC of 0.013 mg/kg in fifteen primary and one duplicate sample. Detected concentrations above the RBTC ranged from 0.0156 mg/kg to 286J mg/kg with the estimated maximum concentration detected in soil boring E20 at 5.5 feet bgs.
- 2-Butanone (methyl ethyl ketone) was detected in a total of 78 soil samples. 2-Butanone exceeded the RBTC of 5,300 mg/kg in three primary and one duplicate sample. Detected concentrations above the RBTC ranged from 7,070 mg/kg to 19,700 mg/kg with the maximum concentration detected in soil boring E20 at a depth of 5.5 feet bgs.

- Chlorobenzene was detected in a total of 12 soil samples. Chlorobenzene exceeded the RBTC of 4.8 mg/kg in three primary and one duplicate sample. Detected concentrations above the RBTC ranged from 21.9 mg/kg to 157J mg/kg with the estimated maximum concentration detected in soil boring I21 at 8.5 feet bgs.
- Chloroform was detected in one soil sample above the RBTC of 0.0029 mg/kg. The reported concentration was 1.53J mg/kg in soil boring J22 at 5.0 feet bgs.
- 1,2-Dichlorobenzene was detected in a total of 11 soil samples. 1,2-Dichlorobenzene exceeded the RBTC of 51 mg/kg in one primary sample. The reported concentration was 113J mg/kg detected in soil boring F24 at 5.0 feet bgs.
- 1,4-Dichlorobenzene was detected in a total of three soil samples. 1,4-Dichlorobenzene exceeded the RBTC of 0.05 mg/kg in three primary samples. Detected concentrations above the RBTC ranged from 0.0694 mg/kg to 1.41J mg/kg with the estimated maximum concentration detected in soil boring J18 at 9.5 feet bgs.
- 1,1-DCA was detected in a total of 20 soil samples. 1,1-DCA exceeded the RBTC of 0.028 mg/kg in twelve primary and two duplicate samples. Detected concentrations above the RBTC ranged from 0.0662 mg/kg to 182 mg/kg with the maximum concentration detected in soil boring I17 at 8.0 feet bgs.
- 1,2-DCA was detected in a total of 14 soil samples. 1,2-DCA exceeded the RBTC of 0.0088 mg/kg in ten primary and two duplicate samples. Detected concentrations above the RBTC ranged from 4.87 mg/kg to 1,010 mg/kg with the maximum concentration detected in soil boring I21 at 8.5 feet bgs.
- 1,1-DCE was detected in a total of six soil samples. 1,1-DCE exceeded the RBTC of 0.9 mg/kg in five primary samples. Detected concentrations above the RBTC ranged from 1.54 mg/kg to 85.8J mg/kg with the estimated maximum concentration detected in soil boring I23 at 9.0 feet bgs.
- Ethylbenzene was detected in a total of 101 soil samples. Ethylbenzene exceeded the RBTC of 0.075 mg/kg in 79 primary and ten duplicate samples. Detected concentrations above the RBTC ranged from 0.0942 mg/kg to 4,190 mg/kg with the maximum concentration detected in soil boring E20 at 5.5 feet bgs.
- Methylene chloride was detected in a total of two samples above the RBTC of 0.14 mg/kg. The concentrations reported were 110 mg/kg and 1,110 mg/kg with the maximum concentration detected in soil boring G21 at 5.0 feet bgs.
- 4-methyl-2-pentanone (methyl isobutyl ketone) was detected in a total of 22 soil samples. 4-methyl-2-pentanone exceeded the RBTC of 1,600 mg/kg in one duplicate sample. The reported concentration was 3,180J mg/kg detected in soil boring E20 at 5.5 feet bgs.

- Naphthalene was detected in a total of 72 soil samples. Naphthalene exceeded the RBTC of 0.35 mg/kg in 46 primary and six duplicate samples. Detected concentrations above the RBTC ranged from 0.621 mg/kg to 482 mg/kg, with the maximum concentration detected in soil boring TP5 at 3.5 feet bgs.
- Styrene was detected in a total of 16 soil samples. Styrene exceeded the RBTC of 190 mg/kg in three primary and one duplicate sample. Detected concentrations above the RBTC ranged from 237 mg/kg to 1,760 mg/kg with the maximum concentration detected in soil boring E20 at 5.5 feet bgs.
- 1,1,2,2-TCA was detected in one soil sample above the RBTC of 0.021 mg/kg. The reported concentration was 308J mg/kg detected in soil boring I21 at 8.5 feet bgs.
- PCE was detected in a total of 33 soil samples. PCE exceeded the RBTC of 0.0048 mg/kg in 27 primary and five duplicate samples. Detected concentrations above the RBTC ranged from 0.0084 mg/kg to 1,200 mg/kg, with the maximum concentration detected in soil boring I17 at 8.0 feet bgs.
- Toluene was detected in a total of 103 soil samples. Toluene exceeded the RBTC of 220 mg/kg in 27 primary and three duplicate samples. Detected concentrations above the RBTC ranged from 370 mg/kg to 7,770 mg/kg, with the maximum concentration detected in soil boring E20 at 5.5 feet bgs.
- 1, 2, 4-Trichlorobenzene was detected in a total of seven soil samples. 1,2,4-Trichlorobenzene exceeded the RBTC of 2.4 mg/kg in four primary and one duplicate samples. Detected concentrations above the RBTC ranged from 11.6 mg/kg to 118J mg/kg with the estimated maximum concentration detected in soil boring D23 at 2.7 feet bgs.
- 1, 1, 1-TCA was detected in a total of 18 soil samples. 1,1,1-TCA exceeded the RBTC of 35 mg/kg in 11 primary and one duplicate samples. Detected concentrations above the RBTC ranged from 65.7 mg/kg to 841 mg/kg with the maximum concentration detected in soil boring I23 at 9.0 feet bgs.
- 1, 1, 2-TCA was detected in a total of 27 soil samples. 1,1,2-TCA exceeded the RBTC of 0.026 mg/kg in 22 primary and three duplicate samples. Detected concentrations above the RBTC ranged from 5.5 mg/kg to 1,600 mg/kg with the maximum concentration detected in soil boring I21 at 8.5 feet bgs.
- TCE was detected in a total of 57 soil samples. TCE exceeded the RBTC of 0.018 mg/kg in 50 primary and five duplicate samples. Detected concentrations above the RBTC ranged from 0.044 mg/kg to 3,290 mg/kg with the maximum concentration detected at soil boring I21 at 8.5 feet bgs.
- 1,2,4,-Trimethylbenzene was detected in a total of 88 soil samples. 1,2,4-Trimethylbenzene exceeded the RBTC of 0.085 mg/kg in 53 primary and eight duplicate

samples. Detected concentrations above the RBTC ranged from 0.996 mg/kg to 1,940 mg/kg with the maximum concentration detected in soil boring E20 at 5.5 feet bgs.

- Vinyl chloride was detected in a total of six primary soil samples. All six samples were above the RBTC of 0.0025 mg/kg. Detected concentrations above the RBTC ranged from 0.0028 mg/kg to 102J mg/kg with the estimated maximum concentration detected in soil boring I17 at 8.0 feet bgs.
- Xylenes were detected in a total of 107 soil samples. Xylenes exceeded the RBTC of 8.9 mg/kg in 48 primary and seven duplicate samples. Detected concentrations above the RBTC ranged from 9.5 mg/kg to 11,600 mg/kg with the maximum concentration detected in soil boring E20 at 5.5 feet bgs.
- tert-Butyl alcohol (TBA) was detected in a total of 14 soil samples (12 primary and two duplicate samples). Concentrations ranged from 0.01 mg/kg to 0.51J mg/kg with the estimated maximum concentration detected in soil boring F20 at 0.5 feet bgs. An RBTC was not developed for TBA. Currently there is neither an RSL nor a CHHSL established for this constituent.
- n-Butylbenzene was detected in a total of 25 soil samples (21 primary and four duplicate samples). Concentrations ranged from 0.07 mg/kg to 210J mg/kg with the estimated maximum concentration detected in soil boring E20 at 5.5 feet bgs. An RBTC was not developed for n-butylbenzene; however, the reported concentrations are below the USEPA industrial soil RSL of 5,100 mg/kg.
- sec-Butylbenzene was detected in a total of six soil samples (five primary and one duplicate samples). Concentrations ranged from 0.085 mg/kg to 13.8J mg/kg with the estimated maximum concentration detected in soil boring F20 at 5.0 feet bgs. An RBTC was not developed for sec-Butylbenzene. Currently there is neither an RSL nor a CHHSL established for this constituent.
- 2-Chlorotoluene was detected in a total of three soil samples (two primary and one duplicate samples). Concentrations ranged from 44.7 mg/kg to 238 mg/kg with the maximum concentration detected in soil boring E24 at 8.0 feet bgs. An RBTC was not developed for 2-chlorotoluene. Currently there is neither an RSL nor a CHHSL established for this constituent.
- Cymene was detected in a total of 12 soil samples (nine primary and three duplicate samples). Concentrations ranged from 0.0024 mg/kg to 13.2J mg/kg with the estimated maximum concentration detected in soil boring F20 at 5.0 feet bgs. An RBTC was not developed for cymene. Currently there is neither an RSL nor a CHHSL established for this constituent.
- n-Propylbenzene was detected in a total of 42 soil samples (36 primary and six duplicate samples). Concentrations ranged from 0.0025 mg/kg to 298J mg/kg with the estimated

maximum concentration detected in soil boring E20 at 5.5 feet bgs. An RBTC was not developed for n-propylbenzene. Currently there is neither an RSL nor a CHHSL established for this constituent.

- 1,2,3-Trichlorobenzene was detected in a total of two primary samples. The reported concentrations were 31.4 mg/kg and 38.1J mg/kg, with the estimated maximum concentration detected in sol boring D23 at 2.7 feet bgs. An RBTC was not developed for 1,2,3-trichlorobenzene; however, the reported concentrations are below the USEPA industrial soil RSL of 490 mg/kg.

#### 4.3.4.3 Semi-Volatile Organic Compounds

The concentrations of SVOCs detected during this investigation are presented below by chemical. A total of 14 chemical constituents were detected in the samples submitted for laboratory analysis. Two of those constituents were detected above their respective RBTC. 49 chemical constituents were not detected above laboratory method detection limits in the samples submitted for laboratory analysis.

- Bis(2-ethylhexyl)phthalate was detected in a total of 16 soil samples. Bis(2-ethylhexyl) phthalate exceeded the RBTC of 140 mg/kg in five primary and one duplicate samples. Detected concentrations above the RBTC ranged from 209 mg/kg to 1,000 mg/kg with the maximum concentration detected in soil boring H20 at 7.0 feet bgs.
- Isophorone was detected in a total of ten soil samples. Isophorone exceeded the RBTC of 2,000 mg/kg in one primary and one duplicate sample. Detected concentrations above the RBTC were 3,710 mg/kg and 3,860 mg/kg with the maximum concentration detected in soil boring H22 at 3.0 feet bgs.
- Benzoic Acid was detected in a total of five soil samples (four primary and one duplicate samples). Concentrations ranged from 5.46 mg/kg to 30.4 mg/kg, with the maximum concentration detected in soil boring F24 at 5.0 feet bgs. An RBTC was not developed for benzoic acid; however, the reported concentrations are below the USEPA industrial soil RSL of 2,500,000 mg/kg.
- Benzyl alcohol was detected in one primary sample. The estimated concentration reported was 3.56J mg/kg in soil boring F24 at 5.0 feet bgs. An RBTC was not developed for benzyl alcohol; however, the reported concentration is below the USEPA industrial soil RSL of 62,000 mg/kg.
- Carbazole was detected in one primary sample at an estimated concentration of 2.07J mg/kg in soil boring H22 at 6.0 feet bgs. An RBTC was not developed for carbazole. Currently there is neither an RSL nor a CHHSL established for this constituent.
- Diethyl phthalate was detected in a total of three soil samples (two primary and one duplicate sample). Concentrations ranged from 19 mg/kg to 34.9 mg/kg with the

maximum concentration detected in soil boring H22 at 3.0 feet bgs. An RBTC was not developed for Diethyl phthalate; however, the reported concentration is below the USEPA industrial soil RSL of 490,000 mg/kg.

- Dimethyl phthalate was detected in a total of six soil samples (four primary and two duplicate samples). Concentrations ranged from 0.242 mg/kg to 71.5 mg/kg with the maximum concentration detected in soil boring H22 at 3.0 feet bgs. An RBTC was not developed for dimethyl phthalate. Currently there is neither an RSL nor a CHHSL established for this constituent.
- 2,4-Dinitrophenol was detected in one primary sample at a concentration of 450 mg/kg in soil boring F24 at 5.0 feet bgs. An RBTC was not developed for 2,4-dinitrophenol; however, the reported concentration is below the USEPA industrial soil RSL of 1,200 mg/kg.
- Di-n-octylphthalate was detected in a total of 13 soil samples (eleven primary and two duplicate samples). Concentrations ranged from 0.49 mg/kg to 3,100 mg/kg with the maximum concentration detected in soil boring H20 at 7.0 feet bgs. An RBTC was not developed for di-n-octyl phthalate. Currently there is neither an RSL nor a CHHSL established for this constituent.
- Diphenylamine was detected in a total of five soil samples (four primary and one duplicate samples). Concentrations ranged from 0.14 mg/kg to 5.86J mg/kg, with the estimated maximum concentration detected in soil boring H20 at 7.0 feet bgs. An RBTC was not developed for diphenylamine; however, the reported concentration is below the USEPA industrial soil RSL of 15,000 mg/kg.
- Hexachlorobenzene was detected in a total of six soil samples (four primary and two duplicate samples). Concentrations ranged from 0.4 mg/kg to 7.59J mg/kg, with the estimated maximum concentration detected in soil boring H22 at 3.0 feet bgs. An RBTC was not developed for hexachlorobenzene; however, four of the reported concentrations are slightly above the USEPA industrial soil RSL of 1.1 mg/kg. These concentrations were detected at the following locations; H20 at 0.5 feet bgs, H22 at 3.0 feet bgs (primary and duplicate samples), and J22 at 5.0 feet bgs.
- 1-Methylnaphthalene was detected in a total of eight soil samples (six primary and two duplicate samples). Concentrations ranged from 0.23 mg/kg to 36.3J mg/kg, with the estimated maximum concentration detected in soil boring H22 at 3.0 feet bgs. An RBTC was not developed for 1-methylnaphthalene; however, the reported concentration is below the USEPA industrial soil RSL of 99 mg/kg.
- Pentachlorophenol was detected in one soil sample at a concentration of 22.8 mg/kg in boring F24 at 5.0 feet bgs. An RBTC was not developed for pentachlorophenol;

however, the reported concentration is slightly above the industrial soil CHHSL of 13 mg/kg.

- Phenanthrene was detected in a total of four soil samples (three primary and one duplicate sample). Concentrations ranged from 0.40 mg/kg to 4.13J mg/kg, with the estimated maximum concentration detected in soil boring H22 at 6.0 feet bgs. An RBTC was not developed for phenanthrene. Currently there is neither an RSL nor a CHHSL established for this constituent.

#### 4.3.4.4 Metals

The concentrations of metals detected at or above their respective RBTCs during this investigation are presented below by detected metal. Three metals were detected in the samples submitted for laboratory analysis and three metals exceeded their respective RBTC or background concentration. The remainder of the metals analyzed were not detected at or above the laboratory method detection limits.

- Arsenic was detected in a total of 77 soil samples. Arsenic exceeded the calculated arsenic background of 16.6 mg/kg in five primary samples. Detected concentrations above the calculated background concentration ranged from 18 mg/kg to 35.7 mg/kg, with the maximum concentration detected in soil boring F20 at 8.5 feet bgs.
- Lead was detected in a total of 86 soil samples. Lead exceeded the RBTC of 320 mg/kg in 23 primary and one duplicate samples. Detected concentrations above the RBTC ranged from 338 mg/kg to 16,600 mg/kg, with the maximum concentration detected in soil boring I19 at 7.0 feet bgs.
- Mercury was detected in a total of 61 soil samples. Mercury exceeded the RBTC of 0.0043 mg/kg in 55 primary and six duplicate samples. Detected concentrations above the RBTC ranged from 0.041 mg/kg to 10.7 mg/kg, with the maximum concentration detected in soil boring I17 at 8.0 feet bgs.

#### 4.3.4.5 Pesticides and Polychlorinated Biphenyls

The pesticides and PCBs detected during this investigation are presented below. No pesticides were detected above their respective RBTCs. The detected PCBs are presented below.

- Aroclor-1254 was detected in a total of 15 primary soil samples. Aroclor-1254 exceeded the RBTC of 0.83 mg/kg in ten primary samples. Detected concentrations above the RBTC ranged from 1.05 mg/kg to 490 mg/kg, with the maximum concentration detected in soil boring H20 at 7.0 feet bgs.
- Aroclor-1260 was detected in nine primary samples. Aroclor-1260 exceeded the RBTC of 0.83 mg/kg in two primary samples. Detected concentrations above the RBTC ranged from 0.87 mg/kg to 6.5 mg/kg, with the maximum concentration detected in soil boring J16 at 5.0 feet bgs.

- Aroclor-1248 was detected above the RBTC of 0.83 mg/kg in one primary sample at a concentration of 1.37 mg/kg in soil boring J20 at 8.5 feet bgs.

#### 4.3.5 *Results Summary*

The Northern Area is impacted by chemicals released historically during settling pond operations and by the poor condition of fill materials used to backfill the ponds. It appears that the chemical waste placed in the ponds remains there today. The areas of impacts are bounded on the north by the former levees. The southern portion of the Northern Area is also impacted, likely due to a mix of past waste handling practices between processing, storage and pond use.

Waste materials and debris were encountered beneath the following areas; the former drum sampling area, the former drum crusher area, the former south drum storage building, the drum pumping area and the liquefaction area. Based on historic aerial photographs this is approximately the same area where the ponds were previously located.

Soil analytical results indicate that the soil has been impacted in the Northern Area. The predominant detected compounds were VOCs and metals. The highest VOC concentrations of these chemical constituents were detected in the deeper soil samples. This data indicates that the impacts to the soil in this area may be related with the historical uses and backfill operations.

In addition, soil results throughout the Northern Area indicate metal impacts in the shallow, medium and deep sampled intervals (ground surface to 3.0 feet bgs, 3.0 to 6.0 bgs and 6.0 to 10.0 bgs, respectively). The only metals detected above their respective screening criteria (calculated background value or RBTC) are arsenic, lead, and mercury. Arsenic detected above background and lead and mercury detected above their respective RBTCs may indicate that these constituents were associated with chemical handling and storage in this area or the waste fill material used to fill in the former ponds.

### 4.4 **Truck Wash Area**

This section describes the results of the investigation conducted in the Truck Wash Area of the Site.

#### 4.4.1 *Activities Performed*

Investigative activities conducted in the Truck Wash Area of the Site included the drilling and sampling of three borings. Two of the borings were located immediately adjacent to the sumps and one boring was located along the outer edge of the containment area.

#### 4.4.2 *Deviations from the CSAP*

Field activities were conducted in accordance with the procedures presented in the CSAP, except for the following deviations:

- Sample depths for the three borings were adjusted plus or minus 0.5 feet based on field observations and obstructions encountered during drilling operations.

- The proposed number of samples to be collected was adjusted in some locations based on soil conditions and materials encountered during sampling activities. See Table 1 for a complete list of proposed and final samples collected during this investigation.

#### 4.4.3 *Field Observations*

In general, the area is covered in concrete and the concrete thickness varied from approximately six inches to ten inches. Gravel fill was encountered below the concrete and ranged from zero to seven inches thick. Soil consisting of silt, fine grained sand and silty sand was encountered below the gravel fill to the total explored depth of approximately 8.0 feet. Groundwater was not encountered in any of the borings advanced.

#### 4.4.4 *Soil Analytical Data*

A total of nine primary soil samples were collected from the three borings drilled in the Truck Wash Area. Tables 2 through 7 present the concentrations of petroleum hydrocarbons, VOCs, SVOCs, metals, pesticides and PCBs. The results from the soil sampling are summarized below, relative to their respective RBTC's, RSL's, or CHHSL's if a numerical value has been established.

The soil sampling laboratory analytical results are discussed below.

##### 4.4.4.1 Petroleum hydrocarbons

The concentrations of petroleum hydrocarbons detected during this investigation are presented below. RBTCs were not developed for petroleum hydrocarbons.

- GRO was detected in one primary soil sample. The reported concentration was 0.9 mg/kg in soil boring Z 16/17 at 0.9 feet bgs.
- DRO was detected in one primary soil sample. The reported concentration was 6.65J mg/kg in soil boring Z 16/17 at 0.9 feet bgs.

##### 4.4.4.2 Volatile Organic Compounds

The concentrations of VOCs detected during this investigation are presented below by detected chemical. Five VOCs were detected in the samples submitted for laboratory analysis and one exceeded its respective RBTC. The remainder of the VOCs analyzed were not detected at or above the laboratory method detection limit.

- Vinyl chloride was detected in a total of two primary soil samples. Vinyl chloride exceeded the RBTC of 0.0025 mg/kg in one of the primary samples. The reported concentration was 0.014 mg/kg, in soil boring Z 16,17 at 3.4 feet bgs.
- Tertiary amyl methyl ether was detected in one primary sample at a concentration of 0.0057 mg/kg, in soil boring Z 16,17 at 3.4 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.

- Tertiary butyl alcohol was detected in a total of two primary samples. Concentrations were 0.0105 mg/kg and 0.015J mg/kg, with the estimated maximum concentration detected in soil boring Y17 at 3.4 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- Di-isopropyl Ether was detected in one primary sample at an estimated concentration of 0.0012J mg/kg in soil boring Z 16,17 at 3.4 feet bgs. An RBTC was not developed for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 10,000 mg/kg.
- n-Propylbenzene was detected in a total of two primary soil samples. Concentrations detected were 0.002 mg/kg and 0.0023J mg/kg, with the estimated maximum concentration detected in soil boring Z 16,17 at 3.4 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.

#### 4.4.4.3 Semi-Volatile Organic Compounds

No SVOCs were detected at or above the laboratory method detection limits.

#### 4.4.4.4 Metals

The concentrations of metals detected at or above their respective RBTCs or background concentrations are presented below by metal.

- Arsenic was detected in a total of six primary soil samples. Arsenic exceeded the calculated background value of 16.6 mg/kg in two primary samples. Reported concentrations were 32.0 mg/kg and 52.4 mg/kg, with the maximum concentration detected in soil boring Z 16,17 at 3.4 feet bgs.
- Mercury was detected in a total of four primary soil samples. Mercury exceeded the RBTC of 0.0043 mg/kg in all four samples. Concentrations above the RBTC ranged from 0.038 mg/kg to 0.14 mg/kg, with the maximum concentration detected in soil boring Z 16,17 at 0.9 feet bgs.

#### 4.4.4.5 Pesticides and Polychlorinated Biphenyls

Two pesticides were detected in the samples submitted for laboratory analysis; however, reported concentrations were below their respective RBTC's. No other pesticides were detected above laboratory method detection limits. PCBs were not detected above laboratory method detection limits in the samples submitted for laboratory analysis.

#### 4.4.5 Results Summary

Soil results in the Truck Wash Area indicate only minor impacts to soil. The soil in this area was anticipated to be relatively non-impacted based on the lack of chemical handling and the facility processes conducted.

Based on the absence of elevated VOCs, (with the exception of the low level detection of vinyl chloride), SVOCs and the low concentrations of petroleum hydrocarbons detected, it does not appear that a significant release of organic chemicals has occurred in the Truck Wash Area.

However, metals were detected in the shallow, medium and deep sampled intervals (ground surface to 0.5 feet bgs, 2.5 to 3.0 bgs and 5.5 to 6.0 bgs, respectively). The only metals detected above their respective screening criteria (calculated background value or RBTC) are arsenic and mercury.

### 4.5 Western Area

The Western Area of the Site is located west and southwest of the Central Processing Area and consists of Tank farm "Q", the west storage building #2, the west storage lot and facility maintenance building, a portion of the former south drum storage area, and a portion of the former off site auto wrecking yard (Figure 2).

#### 4.5.1 Activities Performed

Investigative activities conducted in the Western Area included the drilling and sampling of 49 borings. In general, the borings were located systematically throughout the Western Area (Figure 3).

#### 4.5.2 Deviations from the CSAP

Field activities were conducted in accordance with the procedures presented in the CSAP, except for the following deviations:

- Sample depths for the 49 borings were adjusted plus or minus 0.5 to 1.0 feet based on field observations and obstructions encountered during drilling operations.
- Soil boring P1 was relocated approximately 75 feet north of its original location, in attempts to investigate possible impacts from a sump drain.

#### 4.5.3 Field Observations

The soil conditions encountered varied significantly between Tank farm Q and the remainder of the Western Area.

Tank farm Q was constructed approximately three to four feet below the surrounding grade. The floor of Tank farm Q is entirely covered in concrete approximately eight to ten inches thick. Each tank sat on an approximately one foot high hexagonal elevated concrete pad or curb. Each pad was covered in concrete and each curbed area was filled with sand. One area of the floor

was cut in the shape of a tank pad but was only filled with sand flush to the containment area floor. The remaining concrete pads were cast with concrete. Sand fill was encountered below the concrete pads and ranged from 1 inch to 12 inches thick. Soil consisting of silt, fine to coarse grained sand and silty sand was encountered below the sand fill to the total explored depth of approximately eight feet bgs. Strong odors were noted from approximately two to eight feet bgs. Groundwater was not encountered in every boring advanced, however; evidence of groundwater was typically observed at approximately seven feet below the floor of the below grade containment.

In general, the remainder of the Western Area outside of Tank farm Q is covered in concrete and the concrete thickness varied from approximately six inches to ten inches thick. Gravel fill was encountered below the concrete and ranged from zero to six inches thick. Soil consisting of silts, fine to coarse grained sands and silty sands were encountered below the gravel fill to the total advanced depth of approximately eight feet bgs. Odors in soil were rarely noted in the remainder of the Western Area. Groundwater was not encountered in every boring advanced, however; evidence of groundwater was typically observed at approximately seven feet bgs.

#### *4.5.4 Soil Analytical Data*

A total of 154 samples (142 primary and 12 duplicates) were collected from the 49 borings advanced in the Western Area of the Site. Tables 2 through 7 present the concentrations of petroleum hydrocarbons, VOCs, SVOCs, metals, pesticides and PCBs. The results from the soil sampling are summarized below, relative to their respective RBTCs, RSLs, or CHHSLs, if a numerical value has been established.

The soil sampling laboratory analytical results are discussed below.

##### 4.5.4.1 Petroleum Hydrocarbons

The concentrations of petroleum hydrocarbons detected during this investigation are presented below. RBTCs were not developed for petroleum hydrocarbons.

- GRO was detected in a total of 27 soil samples (24 primary and three duplicate samples). Concentrations ranged from 0.0616 mg/kg to 557 mg/kg, with the maximum concentration detected in soil boring OP-9 at 0.5 feet bgs
- DRO was detected in a total of 73 soil samples (66 primary and seven duplicate samples). Concentrations ranged from 5.02 mg/kg to 9,500 mg/kg, with the maximum concentration detected in soil boring S2 at 3.0 feet bgs.
- MORO was detected in a total of 52 soil samples (45 primary and seven duplicate samples). Concentrations ranged from 10.4 mg/kg to 4,160 mg/kg, with the maximum concentration detected in soil boring V5 at 1.0 feet bgs

#### 4.5.4.2 Volatile Organic Compounds

The concentrations of VOCs detected during this investigation are presented below by chemical. Twenty five chemical constituents were detected in the samples submitted for laboratory analysis and detected concentrations in 16 samples exceeded their respective RBTCs.

- Benzene was detected in a total of 18 soil samples. Benzene exceeded the RBTC of 0.013 mg/kg in ten samples. Concentrations above the RBTC ranged from 0.0643 mg/kg to 6.77 mg/kg, with the maximum concentration detected in soil boring R10 at 6.0 feet bgs.
- Chloroform was detected in a total of two samples. Chloroform exceeded the RBTC of 0.0029 mg/kg in both samples. Concentrations above the RBTC detected were 0.476 mg/kg and 27.4J mg/kg, with the estimated maximum concentration detected in soil boring O8 at 1.2 feet bgs.
- 1,1-DCA was detected in a total of 27 soil samples. 1,1-DCA exceeded the RBTC of 0.028 mg/kg in 22 samples. Concentrations above the RBTC ranged from 0.0327 mg/kg to 103 mg/kg, with the maximum concentration detected in soil boring O8 at 1.2 feet bgs.
- 1,1-DCE was detected in a total of 16 soil samples. 1,1-DCE exceeded the RBTC of 0.9 mg/kg in five samples. Concentrations above the RBTC ranged from 1.11 mg/kg to 31.4J mg/kg, with the estimated maximum concentration detected in soil boring O8 at 1.2 feet bgs.
- Ethylbenzene was detected in a total of 39 soil samples. Ethylbenzene exceeded the RBTC of 0.075 mg/kg in 31 primary samples and three duplicate samples. Concentrations above the RBTC ranged from 0.117 mg/kg to 484 mg/kg, with the maximum concentration detected in soil boring O8 at 1.2 feet bgs.
- Methylene chloride was detected in a total of nine primary samples. Methylene chloride exceeded the RBTC of 0.14 mg/kg in all nine samples. Concentrations above the RBTC ranged from 0.178 mg/kg to 57.4JB mg/kg, with the estimated maximum concentration detected in soil boring O8 at 1.2 feet bgs.
- Naphthalene was detected in a total of eleven soil samples. Naphthalene exceeded the RBTC of 0.35 mg/kg in five primary samples. Concentrations above the RBTC ranged from 0.39 mg/kg to 16.3J mg/kg, with the estimated maximum concentration detected in soil boring O8 at 1.2 feet bgs.
- 1,1,2,2- TCA was detected in a total of three primary samples. 1,1,2,2- TCA exceeded the RBTC of 0.021 mg/kg in all three samples. Concentrations above the RBTC ranged from 0.0497 mg/kg to 12.6 mg/kg, with the maximum concentration detected in soil boring OP7,8 at 1.3 feet bgs.

- PCE was detected in a total of 34 soil samples. PCE exceeded the RBTC of 0.0048 mg/kg in 27 primary samples and two duplicate samples. Concentrations above the RBTC ranged from 0.0055 mg/kg to 979E mg/kg, with the estimated maximum concentration detected in soil boring R10 at 6.0 feet bgs.
- Toluene was detected in a total of 35 soil samples. Toluene exceeded the RBTC of 220 mg/kg in eight primary samples and two duplicate samples. Concentrations above the RBTC ranged from 229 mg/kg to 1,810E mg/kg, with the estimated maximum concentration detected in soil boring O8 at 1.2 feet bgs.
- 1, 1, 1-TCA was detected in a total of 21 soil samples. 1,1,1-TCA exceeded the RBTC of 35 mg/kg in four primary samples. Concentrations above the RBTC ranged from 377 mg/kg to 1,190 mg/kg, with the maximum concentration detected in soil boring OP7, 8 at 1.3 feet bgs.
- 1, 1, 2-TCA was detected in a total of four soil samples. 1, 1, 2-TCA exceeded the RBTC of 0.026 mg/kg in two primary samples and one duplicate sample. Concentrations above the RBTC ranged from 0.659 mg/kg to 11.7J mg/kg, with the estimated maximum concentration detected in soil boring N7 at 0.3 feet bgs.
- TCE was detected in a total of 53 soil samples. TCE exceeded the RBTC of 0.018 mg/kg in 29 primary samples. Concentrations above the RBTC ranged from 0.0217 mg/kg to 723 mg/kg, with the maximum concentration detected in soil boring QR7, 8 at 1.0 feet bgs.
- 1,2,4,-Trimethylbenzene was detected in a total of 38 soil samples. 1,2,4,-Trimethylbenzene exceeded the RBTC of 0.85 mg/kg in 17 primary samples and three duplicate samples. Concentrations above the RBTC ranged from 1.14 mg/kg to 149 mg/kg, with the maximum concentration detected in soil boring O8 at 1.2 feet bgs.
- Vinyl chloride was detected in a total of 18 soil samples. Vinyl chloride exceeded the RBTC of 0.0025 mg/kg in 14 primary samples and one duplicate sample. Concentrations above the RBTC ranged from 0.0031 mg/kg to 1.02 mg/kg, with the maximum concentration detected in soil boring R10 at 6.0 feet bgs.
- Xylenes were detected in a total of 40 soil samples. Xylenes exceeded the RBTC of 8.9 mg/kg in 16 primary samples and two duplicate samples. Concentrations above the RBTC ranged from 10.1 mg/kg to 1,760 mg/kg, with the maximum concentration detected in soil boring O8 at 1.2 feet bgs.
- Bromobenzene was detected in a total of five primary samples. Concentrations ranged from 0.0067 mg/kg to 152 mg/kg, with the maximum concentration detected in soil boring Q10 at 2.0 feet bgs. An RBTC was not developed for this constituent; however, the reported concentrations are below the USEPA industrial soil RSL of 1,800 mg/kg.

- tert-Butyl alcohol was detected in a total of two primary samples. Concentrations were 0.0561 mg/kg and 0.111 mg/kg, with the maximum concentration detected in soil boring O8 at 6.7 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- n-Butylbenzene was detected in a total of ten soil samples (nine primary and one duplicate sample). Concentrations ranged from 0.0013 mg/kg to 4.84J mg/kg, with the estimated maximum concentration detected in soil boring OP7, 8 at 1.3 feet bgs. An RBTC was not developed for this constituent; however, the reported concentrations are below the USEPA industrial soil RSL of 51,000 mg/kg.
- sec-Butylbenzene was detected in a total of seven soil samples (six primary samples and one duplicate sample). Concentrations ranged from 0.0013 mg/kg to 1.03J mg/kg, with the estimated maximum concentration detected in soil boring QR7, 8 at 1.0 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- tert-Butylbenzene was detected in one primary sample at an estimated concentration of 0.0021J mg/kg in boring PQ8 at 6.8 feet bgs. Currently there is neither an RSL nor a CHHSL established for this constituent.
- 2-Chlorotoluene was detected in one primary sample at an estimated concentration of 0.16J mg/kg in soil boring PQ8 at 1.3 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- Cymene was detected in a total of seven soil samples (six primary and one duplicate sample). Concentrations ranged 0.0011 mg/kg to 1.5J mg/kg, with the estimated maximum concentration detected in soil boring QR8, 9 at 3.4 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- Dichlorodifluoromethane was detected in one primary sample. The estimated concentration was 0.0123J mg/kg in soil boring O8 at 6.7 feet bgs. An RBTC was not developed for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 400 mg/kg.
- n-Propylbenzene was detected in a total of 24 soil samples (22 primary and two duplicate samples). Concentrations ranged from 0.0018 mg/kg to 27.3J mg/kg, with an estimated maximum concentration detected in soil boring O8 at 1.2 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.

#### 4.5.4.3 Semi-Volatile Organic Compounds

The concentrations of SVOCs detected are presented below by chemical. Five chemical constituents were detected in the samples submitted for laboratory analysis and one exceeded its respective RBTC.

- Benzoic Acid was detected in one primary sample at a reported concentration of 1.22 mg/kg, in soil boring OP9 at 0.5 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 2,500,000 mg/kg.
- 2,4-Dimethylphenol was detected in one duplicate sample at an estimated concentration of 0.21J mg/kg in soil boring N7 at 0.3 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 12,000 mg/kg.
- Di-n-octyl phthalate was detected in three primary samples. Concentrations ranged from 0.30 mg/kg to 3.13J mg/kg, with the estimated maximum concentration detected in soil boring BB2 at 1.5 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- 1-Methylnaphthalene was detected in a total of two soil samples (one primary and one duplicate sample). Concentrations detected were 0.18 mg/kg and 0.33J mg/kg, with the estimated maximum concentration detected in soil boring OP9 at 0.5 feet bgs. An RBTC was not established for this constituent; however, the reported concentrations are below the USEPA industrial soil RSL of 99 mg/kg.
- Phenanthrene was detected in one primary sample at an estimated concentration of 0.22J mg/kg in soil boring OP9 at 0.5 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.

#### 4.5.4.4 Metals

The concentrations of metals detected at or above their respective RBTCs are presented below.

- Lead was detected in a total of 82 soil samples. Lead exceeded the RBTC of 320 mg/kg in one primary sample. The reported concentration was 357 mg/kg in soil boring V5 at 1.0 feet bgs.
- Mercury was detected in a total of 18 soil samples. Mercury exceeded the RBTC of 0.0043 mg/kg in 16 primary and two duplicate samples. Concentrations above the RBTC ranged from 0.039 mg/kg to 0.48 mg/kg, with the maximum concentration detected in soil boring M2 at 0.9 feet bgs.

- Total chromium was detected in a total of 109 soil samples (100 primary samples and nine duplicate samples). Concentrations ranged from 20.5 mg/kg to 994 mg/kg, with the maximum detected concentration found in soil boring AA12 at 3.5 feet bgs.

#### 4.5.4.5 Pesticides and Polychlorinated Biphenyls

The concentrations of detected PCBs are presented below. No pesticides were detected in the Western Area.

- Aroclor-1248 was detected in a total of ten soil samples (nine primary samples and one duplicate sample). Aroclor-1248 exceeded the RBTC of 0.83 mg/kg in four primary samples. Concentrations above the RBTC ranged from 0.934mg/kg to 161 mg/kg, with the maximum concentration detected in soil boring N6 at 0.8 feet bgs.
- Aroclor-1254 was detected in a total of eleven soil samples. Aroclor-1254 exceeded the RBTC of 0.83 mg/kg in one primary sample. The reported concentration was 4.92 mg/kg, detected in soil boring M2 at 0.9 feet bgs.
- Aroclor-1260 was detected in a total of nine soil samples (eight primary samples and one duplicate sample). Aroclor-1260 exceeded the RBTC of 0.83 mg/kg in one primary sample. The reported concentration was 1.65 mg/kg, detected in sample M2 at 0.9 feet bgs.

#### *4.5.5 Results Summary*

A subsurface investigation was performed in the Western Area to investigate potential releases from chemicals storage and former auto wrecking operations in this area.

Soil samples collected beneath Tank farm Q indicate elevated concentrations (above their respective RBTC's) of multiple constituents including the following; benzene, toluene, ethylbenzene, xylenes, PCE and TCE. The elevated detections were found in the shallow (0 to 0.5 feet bgs), medium (2.5 to 3.0 feet bgs) and deep (5.5 to 6.0 feet bgs) sample intervals (as measured from the below grade floor of the containment).

Results from samples collected between Tank farm Q and the West Storage Building indicated the presence of gasoline, diesel and motor oil range organics. The detections were found in the shallow and medium sample intervals. These data indicates that impacts to the soil in this area may be attributed to the historic auto wrecking yard operations or processing wastes from operations.

Soil results from samples collected inside and outside of the West Storage Building indicated only a few samples with elevated levels of TCE and PCE. The elevated detections were predominantly found in the shallow (0 to 0.5 feet bgs) samples inside the building's containment area. This data suggests that minor releases from Site operations may have occurred in this area.

Soil results from samples collected in the truck and facility maintenance building as well as the west storage lot indicate the presence of gasoline, diesel and motor oil range organics, and TCE.

The detections were found predominantly at the shallow and medium sample depths, with some detections of TCE in the deep samples. These data suggest that impacts to soil in this area may have been due to the historic auto wrecking yard activities and to past Site operations.

Soil results in the entire Western Area indicate metal impacts in the shallow sample intervals. The only metals detected above their respective RBTCs are lead and mercury.

#### **4.6 Panhandle and Eastern Area**

This section describes the results of the investigation conducted in the Panhandle and eastern portion of the Site. The Panhandle and eastern portion of the Site encompasses the area directly east of the Central Processing Area and extending south to Bay Road. Included in this area are a former office building, an office and laboratory building, a septic tank (SWMU #3), a runoff sump separator (SWMU # 4), an elevated parking area, and the driveway and adjacent undeveloped land (former area of historic auto wrecking operations). The Panhandle and Eastern Area is shown on Figure 2.

The septic tank is located adjacent to the northern-most office building and is discussed further in Section 4.7.

##### *4.6.1 Activities Performed*

Investigation activities conducted in the Panhandle and Eastern Area of the Site included advancing 24 soil borings and collecting soil samples. In general, the borings were located in the undeveloped area and in and around the office and laboratory buildings (Figure 3). Groundwater was samples at the request of the Joint Agencies to assess whether groundwater containing chemical constituents is migrating toward the historic auto wrecking portions of this area.

##### *4.6.2 Deviations from the CSAP*

Field activities were conducted in accordance with the CSAP, except for the following deviations:

- Sample depths for the 24 borings were adjusted plus or minus 0.5 to 1.0 feet based on field observations and obstructions encountered during drilling operations.
- The location of soil Boring P25 was slightly adjusted in order to better investigate the septic tank.
- The location of soil boring P27 was slightly adjusted in order to better investigate the run-off sump separator.
- The location of soil boring Bb19 was slightly adjusted due to the presence of office trailers over the original location.
- The location of soil boring M19 was slightly adjusted to avoid onsite groundwater remediation injection wells.

#### 4.6.3 *Field observations*

With the exception of the gravel and grass-covered areas in the Panhandle Area, the remainder of the Panhandle and Eastern Area is covered in concrete and the concrete thickness varied from approximately five inches to seven inches. Gravel fill was encountered below the concrete and ranged from 1 to 30 inches thick. Soil, consisting of silt, fine to coarse grained sands and silty sand was encountered below the gravel fill to the total explored depth of approximately seven feet. Strong odors were observed from approximately 1 to 3 feet bgs in soil boring N25 and N26. Groundwater was not encountered in every boring advanced, however; evidence of groundwater was typically observed at approximately 6 feet bgs, with the exception of boring N25 where groundwater was encountered at 4.9 feet bgs.

#### 4.6.4 *Soil Analytical Data*

A total of 78 samples (64 primary and 14 duplicate) were collected from the 24 borings advanced. Tables 2 through 7 present the concentrations of petroleum hydrocarbons, VOCs, SVOCs, metals, pesticides and PCBs. The results from the soil sampling are summarized below.

##### 4.6.4.1 Petroleum Hydrocarbons

The concentrations of petroleum hydrocarbons detected during this investigation are presented below. RBTCs were not developed for petroleum hydrocarbons.

- GRO was detected in 2 primary samples. Concentrations detected were 0.423 mg/kg and 1,130 mg/kg, with the maximum concentration detected in soil boring N25 at 0.9 feet bgs.
- DRO was detected in a total of 27 samples (24 primary samples and three duplicate samples). Concentrations ranged from 5.07 mg/kg to 1,880 mg/kg, with the maximum concentration detected in soil boring N25 at 0.9 feet bgs.
- MORO was detected in a total of 24 soil samples (21 primary and three duplicate samples). Concentrations ranged from 19.7 mg/kg to 2,220 mg/kg, with the maximum concentration detected in soil boring N25 at 0.9 feet bgs.

##### 4.6.4.2 Volatile Organic Compounds

The concentrations of VOCs detected during this investigation are presented below by chemical. Eleven chemical constituents were detected in the samples submitted for laboratory analysis and five chemical constituents exceeded their respective RBTCs.

- Benzene was detected in a total of nine soil samples. Benzene exceeded the RBTC of 0.013 mg/kg in one primary sample. The reported concentration was 0.024 mg/kg in soil boring R24 at 3.0 feet bgs.

- 1,1-DCA was detected in a total of 16 soil samples. 1,1-DCA exceeded the RBTC of 0.028 mg/kg in one primary sample at a concentration of 0.041 mg/kg in soil boring N26 at 6.5 feet bgs.
- Ethylbenzene was detected in a total of seven soil samples. Ethylbenzene exceeded the RBTC of 0.075 mg/kg in two primary samples and one duplicate sample. Concentrations above the RBTC ranged from 0.0839 mg/kg to 1.55J mg/kg, with the estimated maximum concentration detected in soil boring N25 at 0.9 feet bgs.
- 1,2,4,-Trimethylbenzene was detected in a total of six soil samples. 1,2,4 trimethylbenzene exceeded the RBTC of 0.085 mg/kg in one primary sample. The reported concentration was 27 mg/kg, in soil boring N25 at 0.9 feet bgs.
- Vinyl chloride was detected in a total of four soil samples. Vinyl chloride exceeded the RBTC of 0.0025 mg/kg in two primary samples. Concentrations above the RBTC ranged from 0.0027 mg/kg to 0.0047 mg/kg, with the maximum concentration detected in soil boring V26 at 3.4 feet bgs.
- tert-Butyl alcohol (TBA) was detected in a total of four soil samples (three primary samples and one duplicate sample). Concentrations ranged from 0.0098 mg/kg to 0.0343 mg/kg, with the maximum concentration detected in soil boring Z27 at 6.5 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- n-Butylbenzene was detected in one primary sample at a reported concentration of 2.69 mg/kg in soil boring N25 at 0.9 feet bgs. An RBTC was not developed for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 51,000 mg/kg.
- sec-Butylbenzene was detected in one primary sample at a reported concentration of 2.31 mg/kg in soil boring N25 at 0.9 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- Cymene was detected in one primary sample at an estimated concentration of 2.18J mg/kg in soil boring N25 at 0.9 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- Di-isopropyl ether was detected in a total of three soil samples (two primary samples and one duplicate sample). Concentrations ranged from 0.0017 mg/kg to 0.002J mg/kg, with the estimated maximum concentration detected in soil boring N26 at both 3.5 feet bgs and 6.5 feet bgs. An RBTC was not developed for this constituent; however the reported concentrations are below the USEPA industrial soil RSL of 10,000 mg/kg.
- n-Propylbenzene was detected in a total of four soil samples (three primary samples and one duplicate sample). Concentrations ranged from 0.0021 mg/kg to 4.67 mg/kg, with the

maximum concentration detected in soil boring N25 at 0.9 feet bgs. An RBTC was not developed for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.

#### 4.6.4.3 Semi-Volatile Organic Compounds

The concentrations of SVOCs detected during this investigation are presented below by chemical. Eleven chemical constituents were detected in the samples submitted for laboratory analysis; however, detected concentrations were below their respective RBTC's or RSL.

- Anthracene was detected in one primary sample at an estimated concentration of 1.71J mg/kg in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 10,000 mg/kg.
- Benzo(a)anthracene was detected in one primary sample at an estimated concentration of 4.63J mg/kg in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is slightly above the USEPA industrial soil RSL of 2.1 mg/kg.
- Benzo(a)pyrene was detected in one primary sample at an estimated concentration of 4.56J mg/kg in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is above the USEPA industrial soil RSL of 0.21 mg/kg.
- Benzo(b)fluoranthene was detected in one sample at an estimated concentration of 4.16J mg/kg in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is slightly above the USEPA industrial soil RSL of 2.1 mg/kg.
- Benzo(g,h,i)perylene was detected in one primary sample at an estimated concentration of 2.88J mg/kg in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent. Currently there is neither an RSL nor CHHSL established for this constituent.
- Benzo(k)fluoranthene was detected in one sample at an estimated concentration of 3.98J mg/kg in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 21 mg/kg.
- Chrysene was detected in one primary sample at a concentration of 5.42 mg/kg in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 210 mg/kg.
- Di-n-octyl phthalate was detected in one primary sample at a concentration of 0.608 mg/kg in soil boring N25 at 0.9 feet bgs. An RBTC was not established for this

constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.

- Indeno(1,2,3-c,d)pyrene was detected in one primary sample at an estimated concentration of 3.27J mg/kg in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is slightly above the USEPA industrial soil RSL of 2.1 mg/kg.
- Phenanthrene was detected in two primary samples. Concentrations detected were 0.194 mg/kg and 9.45 mg/kg, with the maximum concentration detected in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent. Currently there is neither an RSL nor a CHHSL established for this constituent.
- Pyrene was detected in one primary sample at a concentration of 11.3 mg/kg in soil boring KK26 at 0.1 feet bgs. An RBTC was not established for this constituent; however, the reported concentration is below the USEPA industrial soil RSL of 17,000 mg/kg.

#### 4.6.4.4 Metals

The detected metals concentrations exceeding their respective RBTCs are presented below.

- Lead was detected in a total of 49 soil samples. Lead exceeded the RBTC of 320 mg/kg in one primary sample. The maximum reported concentration was 1,650 mg/kg in soil boring EE23 at 1.3 feet bgs.
- Mercury was detected in a total of 13 soil samples. Mercury exceeded the RBTC of 0.0043 in 12 primary samples and one duplicate sample. Concentrations at or above the RBTC ranged from 0.04 mg/kg to 79 mg/kg, with the maximum concentration detected in soil boring GG26 at 0.0 feet bgs.

#### *4.6.5 Groundwater Analytical Data*

Groundwater samples were collected in the Panhandle and Eastern Area and the results are discussed in Section 8.0.

#### *4.6.6 Results Summary*

The northern portion of the Panhandle and Eastern Area encompassed the lab building, the septic tank area, the runoff sump separator and the elevated parking area. Soil results in these northern areas indicate little to no impacts in either shallow, medium or deep sample intervals, with the exception of soil borings N25 and P27, which both had detectable levels of petroleum hydrocarbons (GRO, DRO, and MORO) in the shallow samples.

Soil results for samples in the southern portion of the Panhandle and Eastern Area indicated petroleum hydrocarbon (gasoline, diesel and motor oil range) impacts in the shallow depth samples. Several SVOCs, specifically polycyclic aromatic hydrocarbons, were detected in samples from the single soil boring NN26, located at the southern end of the area.

In addition, various metals were detected in the shallow samples (approximately ground surface to 0.5 feet bgs). The only metals detected above their respective RBTCs were lead and mercury.

#### **4.7 Former Septic Tank**

This section describes the results of the sampling of the liquid and sludge present in the former Septic Tank (Figure 2). As described in the CSAP, the former Septic Tank was an underground wooden tank equipped with internal baffling located north of the original laboratory and office building. The former Septic Tank was possibly connected to the drain system for the former laboratory, and was thus considered a target for investigation. A physical inspection in 2009 revealed approximately four feet of standing liquid in the tank and a sludge layer on the bottom. A plugged discharge line was observed on the north end of the tank. Following these observations, samples from the tank were collected. These samples were collected prior to completion of the CSAP in order to take advantage of onsite construction resources and to determine the level of subsurface investigation to include in the CSAP program. These sampling activities are described in the sections below.

Following the sampling conducted within the septic tank in 2009, the CSAP was prepared with selected soil borings in the vicinity of the former septic tanks. As part of the CSAP investigation, two soil borings were advanced adjacent to the tank (sample locations P23 and P25); one soil boring was advanced in the vicinity of the interior building sewer lines (R24); and one soil boring was advanced in the vicinity of the former onsite laboratory (R25) (Figure 3).

##### *4.7.1 Activities Performed*

Investigative activities in the former Septic Tank included a physical inspection of the tank, an assessment of the contents of the tank, and an effort to identify and trace existing inlet and outlet lines. The free-flowing contents of the tank were pumped from the tank on March 18, 2009 to facilitate inspection and sampling. Liquid and sludge samples were collected from the evacuated volume in glass jars for laboratory analysis. The empty tank was then visually monitored for groundwater re-infiltration.

The suspected discharge line was further inspected and traced on March 20, 2009. For this activity, the concrete plug was removed from the discharge line and a traceable probe cable was inserted. The surface expression of the probe location was used to map the alignment of the pipe.

Liquid and sludge samples were collected for laboratory analysis from the volume of fluids extracted from the tank. All liquid and sludge samples were immediately transferred to laboratory supplied glassware and placed on ice. Standard chain-of-custody protocol was maintained for the soil samples collected for analytical testing.

Sludge and water samples were submitted to Accutest. Samples were analyzed for of the following analyses:

- VOCs using USEPA Method 8260,

- SVOCs using USEPA Method 8270,
- Title 22 metals (total metals) using USEPA Methods 6010B and 7471A (mercury),
- TPH-g, -d, -mo using USEPA Method 8015 modified,
- Pesticides using USEPA Method 8081A; and,
- PCBs using USEPA Method 8082.

Laboratory analytical reports and chain-of-custody documents are included in Appendix E. Laboratory analytical results are included in Tables also included in Appendix E

#### 4.7.2 *Deviations from the CSAP*

Field activities were conducted in advance of completing the CSAP.

#### 4.7.3 *Field Observations*

The former Septic Tank was constructed with a combination of concrete and redwood boards. The tank is divided into three baffled chambers that are interconnected. Water readily moves between chambers. The overall dimensions appear to be approximately 15 to 20 feet long, 3 feet wide, and 3 feet deep. Each chamber is accessed through a small cover. The inlet piping was not connected to an active drain system at the time of inspection. The current building sewer lines discharged to an adjacent pump station that pumped waste water to the City of East Palo Alto system. The former Septic Tank use period likely predates the current system.

Upon completion of sampling and evacuation of liquid and sludge from the tank, Iris Environmental visually monitored the tank for groundwater infiltration. Groundwater rapidly reentered the tank, which demonstrated that the integrity of the tank is compromised. Approximately one to three inches of sludge had settled on the bottom of the tank chambers. Residual sludge remains in the tank.

The discharge line was traced approximately 300 feet west and likely continued further. The contractor was only equipped to trace up to 300 feet. There was no obvious indication of a split or interconnection to another drain line. Depth of the discharge line ranged from approximately two feet next to the tank to four feet at the end of the investigation. The slope of the discharge line combined with the nature of the tank construction indicates that the discharge line was an old gravity drain line. The final termination of the line is not defined.

#### 4.7.4 *Soil Analytical Data*

In total, one water sample and two sludge samples (one from the north chamber and one from the southern chamber) were collected from the former Septic Tank. Water and sludge analytical data and tables are presented in Appendix E. The results from the water and sludge sampling are summarized below. Only the water sample results were compared to the respective RBTCs, ESLs, RSLs, or CHHSLs, if a numerical value has been established. The sludge in the tank will be removed in the future when the tank is excavated.

#### 4.7.4.1 Petroleum Hydrocarbons

The concentrations of petroleum hydrocarbons detected during this investigation are presented below. RBTCs were not developed for petroleum hydrocarbons.

- GRO was detected at a concentration of 200 micrograms per liter ( $\mu\text{g/L}$ ) in water, which does not exceed the groundwater RBTC of 48,000  $\mu\text{g/L}$ . GRO was also detected in the two sludge samples at concentrations of 11 mg/kg and 22 mg/kg.
- DRO was not detected in the one water sample collected. However, DRO was detected at concentrations of 930 mg/kg and 2,100 mg/kg in the two sludge samples collected. However, both results were flagged by the analytical laboratory as exhibiting a chromatographic pattern that does not resemble the diesel standard.
- MORO was not detected in the one water sample collected. However, MORO was detected in the two sludge samples at concentrations of 3,500 mg/kg and 3,700 mg/kg.

#### 4.7.4.2 Volatile Organic Compounds

The concentrations of VOCs detected during this investigation are presented below by chemical.

- Cis-1,2-DCE was detected at 96  $\mu\text{g/L}$  in the one water sample collected and was detected at a concentration of 2,200  $\mu\text{g/kg}$  in one sludge sample. No RBTC has been developed for this compound in water, however the detection is below the ESL (590  $\mu\text{g/L}$ ) for groundwater that is not a current or potential drinking water source.
- 1, 4-Dichlorobenzene was detected in the one water sample collected at a concentration of 4.3  $\mu\text{g/L}$ , which does not exceed the RBTC of 1,500  $\mu\text{g/L}$ , and in one sludge sample at a concentration of 330  $\mu\text{g/kg}$
- Ethylbenzene was detected in the one water sample collected at a concentration of 5.9  $\mu\text{g/L}$ , which does not exceed the RBTC of 4,700  $\mu\text{g/L}$ , and was detected in one sludge sample at 810  $\mu\text{g/kg}$ .
- Methylene chloride was detected in the one water sample collected at a concentration of 66  $\mu\text{g/L}$ , which does not exceed the RBTC of 21,000  $\mu\text{g/L}$ , and was detected in one sludge sample at a concentration of 1,300  $\mu\text{g/kg}$ .

#### 4.7.4.3 Semi-Volatile Organic Compounds

- One SVOC [bis(2-Ethylhexyl)phthalate] was detected in both sludge samples submitted for laboratory analysis.
- Sixty-six SVOCs were not detected above laboratory method detection levels.

#### 4.7.4.4 Metals

The concentrations of metals detected during this investigation above their respective RBTCs are presented below by type.

- Arsenic was not detected above the laboratory reporting limit in the one water sample collected and was detected in the two sludge samples collected at concentrations of 6.6 mg/kg and 8.7 mg/kg.
- Mercury was not detected above the laboratory reporting limit in the one water sample collected and was detected in the two sludge samples collected at concentrations of 0.50 mg/kg and 0.46 mg/kg.

#### 4.7.4.5 Pesticides and Polychlorinated Biphenyls

Aroclor-1260 was not detected above the analytical reporting limit in the one water sample collected and was detected in the two sludge samples at concentrations of 45 ug/kg and 94 ug/kg. No other PCBs or pesticides were detected at or above the laboratory method detection limits.

#### *4.7.5 Results Summary*

Samples of water and sludge collected from the former Septic Tank indicate the presence of chemicals of concern in sludge that do appear to be impacting groundwater. The predominant constituents detected in sludge included: petroleum hydrocarbons, 1,4-dichlorobenzene, ethylbenzene, methylene chloride, arsenic, mercury, and aroclor-1260.

None of the constituents detected in water were at concentrations above site-specific RBTCs for groundwater or ESLs, where no RBTCs exist. Three compounds for which no RBTC or ESL has been developed were also detected in water.

The presence of chemicals in sludge at the bottom of the tank chambers is most likely related to the historical use of the former septic tank, for which no documentation is available. The constituents of concern in the sludge material do not appear to be impacting groundwater as it interacts with the tank interior. A review of the soil and/or groundwater sampling results for nearby borings (P25, P27, and R25) and existing monitoring wells (MW-5A and MW-12A) sampled in the near vicinity further indicates that the elevated concentrations of COCs in the sludge are limited to the interior of the former septic tank.

### **4.8 Buried Utilities and Soil Gas**

Utility corridors can act as preferential pathways for the migration of volatile contaminants. To test whether buried utilities and presumably porous utility backfill materials at Romic were functioning as preferential pathways for migration of VOC vapors away from impacted areas, soil vapor samples were collected along selected utility corridors identified during the utility mapping program. The primary goal of the sampling was to confirm that VOCs were not migrating offsite in soil vapor along the utility corridors. Soil vapor sampling was performed following completion of the soil sampling program, consistent with the decision tree presented as Figure 8 in the CSAP.

#### 4.8.1 *Activities Performed*

Soil vapor samples were collected on September 15 and 16, 2011, in accordance with approved procedures and protocols described in the CSAP and summarized in Section 3.1.4. A total of 21 primary samples were collected and analyzed. With the exception of one sample (SG-2), each of the primary samples was intentionally collected outside the area(s) of identified soil and groundwater VOC impacts as defined by the soil boring program in accordance with the CSAP Work Plan. Each soil vapor sample was collected from an implant installed above groundwater, at a target depth ranging between four and five feet bgs, in or adjacent to mapped utility corridors. The Soil Gas Sampling Logs presented in Appendix B provide a summary of individual sample point construction and sampling, including any deviations from the CSAP.

The 21 primary samples were collected from implants installed in borings advanced by Transglobal Geochemistry Northern California, Inc. of Rancho Cordova, CA (TEG) and analyzed for VOCs in the onsite TEG mobile laboratory using USEPA Method 8260B. Two duplicate samples were collected from the sampling train at borings SG-2 and SG-14 directly following the TEG sampling. The duplicate samples were collected in clean, evacuated Summa canisters and submitted to Air Toxics LTD Laboratory in Folsom, CA for VOC analysis by USEPA Method TO-15. A detailed description of the sampling methods is presented in Section 3.1.4.

Prior to sampling, a purge test was conducted at boring SG-13 on September 15, 2011 under the oversight of DTSC and USEPA Staff. Purge test documentation is presented in Appendix B. The purge test consisted of extracting the calculated combined volumes of tubing and filter pack pore volume for one, three, and seven multipliers. VOCs were not detected above the reporting limits in any of the three purge samples. The default purge volume of three purges was used for the remainder of the sampling program. Samples for analytical testing in the mobile laboratory were collected following purging using gas-tight syringes. Following completion of sampling, the sample tubing was pulled from the ground and the bentonite seal fully hydrated to seal the ground surface. Soil vapor probe construction details are presented in Appendix B.

Standard chain-of-custody protocol was maintained for the soil vapor samples collected for analytical testing. Laboratory analytical results are included in Tables 14 and 15. Laboratory analytical reports and sample chain-of-custody documents are included in Appendix D.

#### 4.8.2 *Deviations from the CSAP*

Field activities were conducted in accordance with the procedures presented in the CSAP, except for the following deviations:

- Boring SG-2 encountered water at two feet bgs and the boring location was relocated at the request of USEPA Staff to a location away from a utility corridor and into an area known to be impacted by VOCs (Figure 3). Therefore, the VOC data from Boring SG-2 are not indicative of VOC concentrations in soil vapor within a utility corridor.

- Four of the 21 soil vapor samples were collected at four feet bgs rather than the targeted depth of five feet due to the presence of groundwater in the borings.
- Four soil vapor borings anticipated in the CSAP were not sampled due to their locations being within areas of VOC impacts. To maintain continuity with the sampling program nomenclature, sample identifiers were not changed. Therefore, soil gas sample locations SG-1, SG-5, SG-7, and SG-8 were not sampled.

#### 4.8.3 Findings

Of the 21 primary soil vapor samples, 20 were collected from locations along utility corridors. The remaining sample (SG-2) was collected within a known area of VOC impacts and was not associated with a utility corridor. None of the primary or duplicate samples collected along utility corridors had reported concentrations of VOCs above their respective RBTCs.

Nine VOCs were detected in one or more of the 20 primary samples collected along utility corridors and analyzed by USEPA Method 8260B: 1,1,2-Trichloro-1,2,2-trifluoroethane (Freon 113), trans-1,2-DCE, 1,1-DCA, 1,1,1-TCA, Benzene, TCE, Toluene, PCE, and xylene.

Fourteen VOCs were detected in the duplicate sample from utility corridor sample SG-14 and analyzed by USEPA Method TO-15. The VOC results are presented in Table 14. Of the fourteen, five did not have calculated RBTCs: 1,3-Butadiene, Hexane, Cyclohexane, Heptane, and 4-Ethyltoluene. Four of these five VOCs were compared to their respective commercial California Human Health Screening Levels (CHHSLs) for soil gas as presented in *Human-Exposure-Based Screening Numbers Developed to Aid Estimation of Cleanup Costs for Contaminated Soil* prepared by the Integrated Risk Assessment Section of the Office of Environmental Health Hazard Assessment (OEHHA), dated November 2004 (January 2005 Revision), and all were below their respective CHHSL. The VOC 4-Ethyltoluene, which was only detected once (SG-14) at a concentration of 8.4  $\mu\text{g}/\text{m}^3$ , does not have an established CHHSL. The detection of 4-Ethyltoluene was interpreted as not indicating a vapor migration or potential vapor intrusion risk due to the single detection and low concentration.

Primary and duplicate samples collected from impacted area boring SG-2 had reported concentrations of VOCs consistent with the soil data collected in the area (Table 14). The primary sample had 18 detected VOCs at concentrations above their reporting limits. Only Vinyl Chloride was detected at a concentration above the RBTC. The duplicate sample had eleven detected VOCs; four of which lacked RBTCs. Of those four without RBTCs, all were at concentrations below their respective CHHSL. Only Vinyl Chloride exceeded the RBTC in the SG-2 duplicate sample. Boring SG-2 was drilled in a location destined for future mitigation and therefore is not considered further in this investigation.

#### 4.8.4 Results Summary

None of the VOCs detected in soil vapor samples collected along utility corridors were at concentrations above site-specific RBTCs for soil vapor or CHHSLs where no RBTCs were

prepared. These findings indicate that VOCs are not migrating away from impacted areas along buried utilities or utility backfill. Further, the data indicate that offsite soil vapor migration is not occurring.

## 5.0 BACKGROUND METALS IN SOIL

Of the metals analyzed in soil during this investigation, only arsenic, lead and mercury exceeded their respective RBTCs. Since, in some cases, it is unclear whether the detected concentrations of these metals are Site related or within the range of naturally occurring background concentrations, Iris Environmental evaluated these three metals to determine if a Site-specific background concentration could be calculated. For each metal, this evaluation included answering the following questions: (1) was the metal detected above the RBTC solely in areas with other chemical impacts, (2) were appropriate regional background studies available, and (3) were the data normally distributed when plotted. Answers to these questions are presented in the table below for each metal.

Metal	Detected Above RBTC Solely in Areas with Other Chemical Impacts?	Regional Background Studies Available?	Were Data Normally Distributed?
Arsenic	No	Yes	Yes
Lead	Yes	No	Not evaluated
Mercury	No	No	No

Since arsenic was the only metal where concentrations were not detected above the RBTC solely in areas with other chemical impacts, where regional background studies were available, and where the data was normally distributed, it was carried forward and a background concentration was calculated. Since lead appeared only to be detected above the RBTC in areas with other chemical impacts, it will likely be remediated along with other chemical impacts. Since no appropriate regional background studies were available for mercury, and when plotted, the data was not normally distributed, a background calculation was not carried forward for mercury. Mercury concentrations above the RBTC will likely be remediated in areas impacted with other chemicals or managed in otherwise non-impacted areas appropriately.

Following this evaluation, Iris Environmental prepared the *Background Metals Analysis Approach* (Iris Environmental, 2012) and submitted the approach to the USEPA on September 27, 2012. This document outlined the approach used to calculate a background concentration for arsenic. A more extensive discussion of the arsenic background calculation is presented in the sections below.

### 5.1 Summary of Available Background and Regional Data

Arsenic can be naturally elevated in soils in the San Francisco Bay Area and several studies, specific to the South San Francisco Bay Area, have been conducted in an attempt to determine background metals concentrations. One researcher determined the background concentration in northern Santa Clara County to be 20 milligrams per kilogram (mg/kg) (Scott, 1991). This concentration was the highest of a background data set compiled from data at sites throughout Santa Clara County. Arsenic, in samples collected from the Guadalupe River has also been reported as high as 55 mg/kg (Andersen, 1998).

Iris Environmental also reviewed data from nearby sites. Specifically, data were reviewed for the 151 Tara Road in East Palo Alto site, located southwest of the Site. Arsenic concentrations at this site were slightly less than those collected at the Romic Site, but generally within the same range. The *Remediation and Risk Management Plan* (EKI, 2007) presented metals data for 151 Tara Road and also invoked a background concentration of 20 mg/kg, taken from Scott (Scott, 1991). No other readily available data could be obtained from nearby sites.

## 5.2 Evaluation of Arsenic

The approach set forth by Cal/EPA (1997, 2009) evaluates whether the data distributions of a specific metal reflect single normal or lognormal populations, or contain multiple populations that would indicate contamination in addition to ambient levels. Cal/EPA recommends a “weight-of-evidence” approach where three indicators of local background/ambient exceedance are considered. The three indicators include: (1) the degree to which the site data distributions are fit by a normal or lognormal distribution; (2) a graphical assessment (probability plot against the normal or lognormal distribution) to identify breaks or nonlinearity indicative of more than a single population; and (3) the skewness of the data as indicated by the coefficient of variation ( $CV = \text{standard deviation}/\text{average}$ ) and the data range (order of magnitude difference between the maximum and minimum concentrations). The arsenic dataset used herein for the ambient determination includes all samples that were collected on Site. This arsenic data set is presented in Table 16.

### 5.2.1 Data Distributions

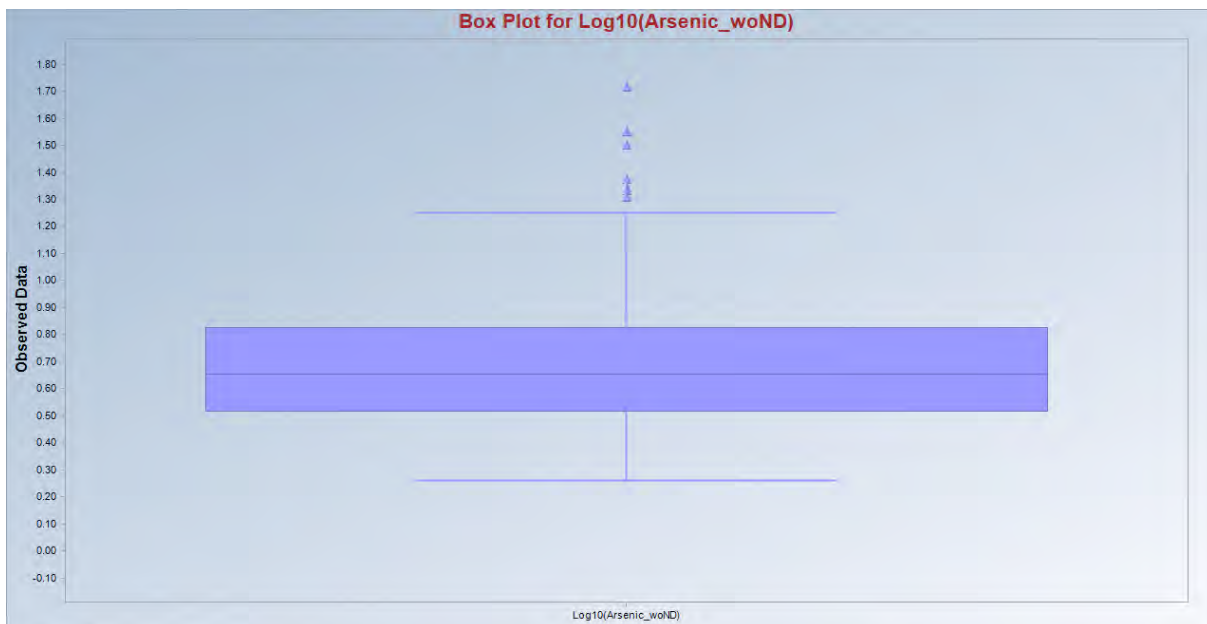

The distribution of the arsenic data set was tested using the Lilliefors test for normality to evaluate whether the data population was normally or lognormally distributed (Gilbert 1987). The test was performed on both raw and log-transformed data sets. At the 95% confidence level, the data population of the entire dataset appears to be lognormally distributed.

### 5.2.2 Graphical Assessment

A visual review of the cumulative probability plots for arsenic (both on the raw and log-transformed datasets) indicates a generally smooth line for the data with several inflection points on the cumulative probability plot for the raw dataset and one inflection point on the cumulative probability plot for the log-transformed dataset. The log-transformed plot is presented below. On this plot, there appear to be inflection points in the distribution at a soil concentration of approximately 3.0 mg/kg, 8.0 mg/kg, and 16 mg/kg (i.e., 0.47 mg/kg, 0.90 mg/kg, and 1.2 mg/kg on log-transformed scale).

In addition to the probability plot, a box plot of the log transformed data was prepared and is presented below. The box plots for log-transformed dataset indicates potential outliers at soil concentrations above approximately 1.3 mg/kg (i.e., 20 mg/kg on non-transformed scale). The visual evidence of the cumulative probability plots along with the results of the outlier test suggest that the arsenic dataset is representative of more than one population (i.e. ambient populations and possible other populations that may be representative of impact from Site operations).

### 5.2.3 Summary Statistics

As indicated in the table below, the arsenic data set, with outliers removed, consists of 114 samples ranging in concentration from 1.79 mg/kg up to 17.98 mg/kg, with a mean of 4.55 mg/kg.

Sample Size	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)	Mean (mg/kg)	Median (mg/kg)	Standard Deviation (mg/kg)	99 <sup>th</sup> Percentile (mg/kg)	Coefficient of Variation
114	1.79 (0.255)	17.98 (1.255)	4.55 (0.658)	4.39 (0.643)	1.63 (0.211)	15.8 (1.2)	1.16

Concentrations in milligrams per kilogram (mg/kg). Log transformed values are in parenthesis.

Typically, data drawn from just one population will display a range of detected values of no more than two orders of magnitude and a coefficient of variation no greater than one. Therefore, based on these criteria, both the range and coefficient of variation for the raw dataset suggest that the arsenic dataset is comprised of one population.

### 5.2.4 Conclusions of the Evaluation of Arsenic

The arsenic dataset was log-normally distributed. Based on the results of the graphical assessment and summary statistics presented above, arsenic is considered to be present at the Site at background concentrations. Thus, a background concentration for arsenic was calculated for the Site as described below.

## 5.3 Development of Arsenic Ambient-Based Screening Concentration

A background concentration for arsenic was calculated per Cal/EPA guidance (2009). Although the arsenic data set tested log-normally distributed, both the raw and log-transformed datasets were evaluated for outliers using the approach discussed below to provide the information necessary to make an informed determination of the representative upper limit of ambient arsenic concentrations.

As per the Cal/EPA guidance (2009), the arsenic data were analyzed for values that do not conform to the pattern established by the majority of values in the dataset (i.e., outliers). The fourth spread ( $f_s$ ) is a measure of spread in a data set that is resistant to outliers and is calculated as follows:

$$f_s = \text{third quartile } [Q_3] - \text{first quartile } [Q_1]$$

The results of the fourth spread analyses are consistent with the box plots of the log-transformed datasets which is a pictorial summary of the most prominent features of a data set, including: 1) center; 2) spread; 3) extent and nature of any departure from symmetry; and 4) identification of any outliers or observations that lie unusually far from the main body of data (Cal/EPA, 2009). As indicated on the box plot, soil concentrations

above approximately 1.3 mg/kg (i.e., 20 mg/kg on non-log transformed scale) are potential outliers.

The results of the fourth spread analysis and the graphical assessment (both cumulative probability and box plot) of the log-transformed arsenic dataset indicate the presence of two distinct populations (i.e., ambient and potential contamination).

In the arsenic dataset, seven data points with arsenic concentrations ranging from approximately 20 mg/kg up to 50 mg/kg were determined to be outliers. The remaining 114 data points with arsenic concentrations ranging from 1.79 mg/kg up to 17.98 mg/kg appear to be representative of ambient levels.

Following the outlier analysis, the 95% upper confidence limit (UCL) of the 99<sup>th</sup> percentile was calculated using ProUCL software. The result was 16.56 mg/kg.

#### **5.4 Summary and Conclusions**

The calculated 95% UCL of the 99<sup>th</sup> percentile of 16.56 mg/kg will be used as the arsenic cleanup goal for the Site to determine areas requiring remediation. This number is conservative, given the background studies that have been performed in the vicinity of the Site, with upper concentrations of those data sets between 20 and 50 mg/kg.

**6.0 MANAGEMENT OF INVESTIGATION DERIVED WASTE**

Investigation-derived waste (IDW), including soil cuttings and equipment wash water were placed in labeled California Department of Transportation-approved 55-gallon drums. Soil cutting drums were transported off-site for disposal by Icon Environmental Services of Union City, California. A total of nine drums containing approximately 450 pounds of soil were transported as non-hazardous waste to Alviso Independent Oil, in Alviso California. Profiling of the soil was based on submittal of laboratory analytical data. The equipment wash water remains on site pending disposal or recycling along with groundwater monitoring purge water. Waste manifests are included in Appendix F.

## 7.0 DATA QUALITY REVIEW

This section addresses the validity and quality of data collected for this investigation. The CSAP set forth data quality objectives for field data collection, laboratory reporting limits and laboratory analyses. The data quality review for the field and laboratory components of this investigation are described below.

### 7.1 Field Data Quality

In general, the field data met the data quality objectives in the CSAP, with the exception of the number of field duplicate soil samples collected and analyzed and the number of samples collected for laboratory matrix spike/matrix spike duplicate analyses (MS/MSD). The CSAP specified that a minimum of 5% of the project samples would be collected for laboratory MS/MSD analyses. However, only approximately 1% was achieved.

### 7.2 Laboratory Data Quality

Reporting limits (RLs) for laboratory analyses were specified in the CSAP and all proposed RLs were below the RBTCs. However, during laboratory analyses, many reporting limits were elevated, primarily due to matrix interference. In an attempt to resolve this issue, Iris Environmental instructed Accutest to re-report the data using lower limits. Accutest re-reported all of the soil and groundwater data using the laboratory method detection limits (MDLs). In most cases, the MDLs were lower or equal to the RBTCs; however, there are a number of cases where the MDL exceeded the RBTCs. These exceedances are presented in Table 17.

Field and laboratory quality control (QC) sample results were used to evaluate the precision, accuracy, representativeness, completeness, and comparability (PARCC) of the analytical data. While not specific to the CSAP, analytical data were reviewed and validated in accordance with the U.S. Environmental Protection Agency (USEPA) *National Functional Guidelines for Organic and Inorganic Data Review* (USEPA 1994, 1999, 2008 and 2010).

The soil and groundwater samples were submitted to Accutest, for chemical analyses. Soil gas samples were analyzed on-site by TEG mobile laboratories out of Rancho Cordova, California. Two duplicate soil gas samples were submitted to Air Toxics, Ltd. in Folsom, California. All samples were received by the laboratories in the proper condition and analytical analyses were performed in accordance with the analyses specified in the chain-of-custody for each sample by a state-certified laboratory. Internal laboratory quality assurance/quality control (QA/QC) results were provided with each sample analytical report. Laboratory analytical reports are presented in Appendix D. The following field and laboratory QC sample results were reviewed to evaluate PARCC:

- Precision: The relative percent difference (RPD) of the laboratory control standard and laboratory control standard duplicate (LCS/LCSD), the matrix spike and matrix spike duplicate (MS/MSD), and the field duplicate samples provides information on the precision of sampling and analytical procedures.

- Accuracy: Evaluation of the percent recovery of spiked analytes in LCS/LCSDs, MS/MSD samples, and surrogates provides information on accuracy.
- Representativeness: Representativeness was assessed through evaluation of method blank and trip blank samples.
- Completeness: Completeness was evaluated using two criteria: (1) by ensuring that all analytical requests were met, samples were received in the proper condition, and all analytes were performed within the technical holding times; and (2) by evaluating the analytical completeness by calculating the percent of acceptable analytes.
- Comparability: To ensure comparability, sampling was performed using standardized procedures by a state-certified laboratory.

All method-specific and laboratory quality control (QC) criteria were met with the exception of those identified and noted in the laboratory data sheets within each analytical report and are summarized in tables provided in Appendix G.

In summary, QA/QC data were reviewed and associated sample results has been qualified with data qualifiers due to the identified data not meeting method-specific and/or laboratory QC criteria. Unusable data are qualified as rejected (“R” flag). All other results are either reported as detected (no flag) or are qualified as not detected (“U” flag), not detected with uncertainty at the detection limit reported (“UJ” flag), or detected with uncertainty at the concentration reported (“J” flag). Analytical soil, groundwater, and soil gas data and associated data qualifiers are summarized in Appendix F. All environmental analytical data collected during the comprehensive soil, groundwater, and soil gas investigation conducted at the Site are usable and acceptable for the purposes of this project with the exception of a small number of results that have been qualified with “R” flag.

## 8.0 DISCUSSION

The following sections present a discussion of Site-wide chemical impacts to soil, groundwater, and soil vapor. The discussions are organized by media type and chemical group, e.g., VOCs, SVOCs, metals.

### 8.1 Soil

To visualize the Site-wide soil impacts, Iris Environmental developed RBTC exceedance contour figures. Four figures were developed; Figure 8 depicts the total count of RBTC exceedances from samples collected between 0 to 2.9 feet bgs; Figure 9 depicts the total count of RBTC exceedances from samples collected between 3.0 to 5.9 feet bgs; Figure 10 depicts the total count of RBTC exceedances from samples collected between 6.0 to 10.0 feet bgs; and Figure 11 shows RBTC exceedances at all depths sampled. As noted on these visualization figures, all chemical and metal exceedances were included, with the exception of mercury. Mercury was not included since the widespread detections are being considered as background for the purpose of the visualization. RBTC's were developed in the CSAP for all anticipated chemicals based on site use. Although additional chemicals were detected and screened against default criteria, the figures provide an adequate interpretation of overall Site impacts. These figures sum all RBTC exceedances for all chemicals which have an RBTC.

The figures depict a pattern in the shallow sampled interval (0 to 2.9 feet bgs, Figure 8), the majority of RBTC exceedances are located in the Central Processing Area and Tank Farm Q located in the Western Area. The majority of RBTC exceedances in the middle sampled interval (3.0 to 5.9 feet bgs, Figure 9) were located in the Northern Area and Central Processing Area, while the majority of RBTC exceedances in the deepest interval sampled (6.0 to 10 feet bgs, Figure 10) was in the Northern Area. Overall, the majority of RBTC exceedances were in the Tank Farm Q portion of the Western Area, the Central Processing Area, and the Northern Area (Figure 12). These exceedances coincide with past chemical use and handling at the Site. In addition to the pervasive impacts discussed above, TCE and mercury exceeded their respective RBTC's in the southwestern portion of the Western Area, in and around the former Truck and Facility Maintenance Building and West Storage Lot. These exceedances occur in the middle and deeper sampled intervals, 3.0 to 5.9 feet bgs and 6.0 to 10 feet bgs, respectively (Figures 9 and 10).

In addition to the RBTC exceedance figures, chemical specific figures (Figures 12 through 31), for key chemicals, were developed to display depth discrete exceedances of the RBTCs. In addition to displaying the exceedances of the respective chemical RBTCs, these figures also display exceedances of 10 times the RBTC, 100 times the RBTC and 1,000 times the RBTC or the maximum detected concentration, whichever is greater. Where appropriate, these figures are referenced in the following sections. However, in general, these figures illustrate that the vast majority of the of the Northern Area, Central Processing Area, and the West Storage Building #2

and Tank Farm Q areas within the Western Area are impacted with many chemicals above their respective RBTCs, and these impacts extend to 8 to 10 feet bgs or to groundwater in most areas.

### 8.1.1 Volatile Organic Compounds

A total of 47 different VOCs were detected in soil collected as part of this investigation. Aromatic hydrocarbons and chlorinated solvent constituents were detected most frequently. Of the aromatic hydrocarbons, xylenes, ethylbenzene, and toluene were the most frequently detected compounds. Xylenes were detected in 242 of 457 soil samples collected at concentrations ranging from 0.00072 mg/kg to 11,600 mg/kg and detected concentrations exceeded the RBTC of 8.9 mg/kg in 128 samples. Ethylbenzene was detected in 235 of 457 soil samples at concentrations ranging from 0.00023 mg/kg to 4,190 mg/kg and detected concentrations of ethylbenzene exceeded the RBTC of 0.075 mg/kg in 205 samples (Figure 14). As shown on Figure 14, numerous detected concentrations exceeded 1,000 times the RBTC value and occurred over a wide portion of the Northern Area, the Central Processing Area and the Tank Farm Q area. Toluene was detected in 235 of 457 soil samples at concentrations ranging from 0.0012 mg/kg to 7,770 mg/kg, with 59 detected concentrations exceeding the RBTC of 220 mg/kg (Figure 13). As shown on Figure 13, most exceedances were in the range of 10 times the RBTC and occurred mostly in the Northern Area, the Central Processing Area and the Tank Farm Q area. However, few detected concentrations in the Northern area were between 10 and 100 times the RBTC value. 1,2,4-Trimethylbenzene was detected in 213 of 457 soil samples at concentrations ranging from 0.001 mg/kg to 1,940 mg/kg and detected concentrations in 143 samples exceeded the RBTC of 0.85 mg/kg (Figure 15). As shown on Figure 15, 1,2,4-Trimethylbenzene detections of 10 to 100 times the RBTC are widespread across the Northern Area and Central Processing Area. Benzene was detected less frequently at concentrations ranging from 0.00019 mg/kg to 286 mg/kg, in 105 of 457 samples, and detected concentrations in 59 samples exceeded the RBTC of 0.013 mg/kg (Figure 12). Benzene exceedances of the RBTC were similar in extent to the other aromatic hydrocarbons noted above and elevated concentrations (10 to 100 times the RBTC )were detected in the Northern Area, the southern portion of the Central Processing Area, and the eastern side of the Tank Farm Q area.

Of the chlorinated solvent related compounds, TCE was detected in 161 of 457 soil samples at concentrations ranging from 0.00076 mg/kg to 3,290 mg/kg and detected concentrations in 121 samples exceeded the RBTC of 0.018 mg/kg (Figure 16). As shown on Figure 16, many detected concentrations exceeded 100 times the RBTC value and were located in the Northern Area, Central Processing Area, and Tank Farm Q area. However, detections above the RBTC to 100 times the RBTC were also detected near the former office/lab building and in and around the former Truck and Facility Maintenance Building in the Western Area. PCE was detected in 114 of 457 soil samples concentrations ranging from 0.0012 mg/kg to 1,200 mg/kg and detected concentrations exceeded the RBTC of 0.0048 mg/kg in 110 samples (Figure 17).

As discussed in Section 4.0, one or more VOCs was detected above the RBTC in essentially every sample collected from the Central Processing Area, the Northern Area, and the former

Tank Farm Q unit in the Western Area, near West Storage Building #2 and in and around the Former Truck and Facility Maintenance Building. In contrast, VOCs above the RBTC were not detected in any soil samples collected across the Site south of the former laboratory building. This pattern confirms that VOC impacts to soil are primarily limited to former processing and storage areas related to past recycling activities, and to a lesser degree to the maintenance areas.

### 8.1.2 *Petroleum Hydrocarbons*

Petroleum hydrocarbon mixtures in the gasoline range (GRO, C<sub>6</sub>-C<sub>10</sub>), diesel range (DRO, C<sub>10</sub>-C<sub>28</sub>), and motor oil range (MORO, C<sub>28</sub>-C<sub>40</sub>) were analyzed for in 216 soil samples. GRO was detected in 73 of 216 soil samples at concentrations ranging from 0.0538 mg/kg to 17,400 mg/kg; DRO was detected in 145 of 216 soil samples at concentrations ranging from 5.02 mg/kg to 25,600 mg/kg; and MORO was detected in 113 of 216 soil samples at concentrations ranging from 10.4 mg/kg to 15,500 mg/kg. The vast majority of the elevated detections were reported in the Northern Area and the Central Processing Area, coincident with impacts from Site chemical processing and storage activities. However, sporadic elevated detections of DRO and MORO were reported in the southern portion of the Panhandle and Eastern Area of the Site (sample locations GG26, KK26, and KK23) and in the Western Area of the Site (sample locations S2 and V5). The detected concentrations in these areas ranged from 5.35 mg/kg to 233 mg/kg for DRO and 19.7 mg/kg to 684 mg/kg for MORO. These detections may be related to historical auto wrecking and storage activities.

No RBTCs were developed for these petroleum hydrocarbon mixtures since the potential risk is related to the individual volatile or semi-volatile compounds contained within the mixtures. However, RBTCs were developed for these key individual compounds and are discussed in the Site specific sections and chemical group specific sections of this report. Since the vast majority of elevated petroleum hydrocarbon detections were coincident with other elevated VOC detections, the concern for gross odor and other secondary issues is not considered a risk issue.

### 8.1.3 *Semi-volatile Organic Compounds*

A total of 37 different SVOCs were detected in soil collected as part of this investigation. Phthalates were the chemical group most frequently detected. Bis(2-ethylhexyl)phthalate was detected in 37 of 100 samples; however, none of the detections exceeded the RBTC of 140 mg/kg. Di-n-octyl-phthalate was the second most detected SVOC and was detected in 24 of 100 samples. No RBTC was established for this constituent. Butyl-benzyl-phthalate was detected in 20 of 100 samples; however, none of the detected concentration exceeded the RBTC of 1,000 mg/kg.

Besides phthalates, naphthalene was also detected frequently. As noted in Section 3.0, naphthalene was analyzed using EPA Method 8260B and EPA Method 8270. The combined analyses indicated that naphthalene was detected in 163 of 457 soil samples at concentrations ranging from 0.0012 mg/kg to 482 mg/kg and detected concentrations exceeded the RBTC of 0.35 mg/kg in 119 samples (Figure 25). As shown on Figure 25, naphthalene was detected at

greater than 100 times the RBTC over a large portion of the Northern Area and in two locations in the Central Processing Area. Otherwise, naphthalene was detected above the RBTC to 100 times the RBTC over most of the Northern Area, Central Processing Area and the Tank Farm Q area, consistent with other chemicals detected at the Site. Besides naphthalene, the other PAHs were rarely detected. For example, most PAHs were detected in the single soil sample KK26, collected from the southern portion of the Panhandle and Eastern Area. However, though PAHs were infrequently detected, many of the laboratory reporting limits for PAHs were elevated. The detected PAHs, in general, are coincident with detections of petroleum hydrocarbons and may be related to petroleum hydrocarbons products used at the Site.

#### 8.1.4 *Metals*

Of the seventeen metals analyzed for, only three metals, lead, arsenic, and mercury, were detected at concentrations exceeding their respective RBTC. Lead was detected in 244 of 280 soil samples at concentrations ranging from 2.0 mg/kg to 16,600 mg/kg and exceeded the RBTC of 320 mg/kg in 28 samples (Figure 27). The pattern of elevated lead detections indicates that the lead is related to fill or historical waste materials placed into the former ponds in the Northern Area and concentrations in this area are greater than 10 times the RBTC, but less than 100 times the RBTC. With the exception of two shallow detections above the RBTC at locations outside of the Former Pond Area, one in the Panhandle and Eastern Area (sample location EE23 [1,650 mg/kg]) and one in the Western Area (sample location V5 [357 mg/kg]), the remainder of Site samples analyzed for lead were below the RBTC for lead.

As described in Section 5.0, a background concentration of 16.6 mg/kg was calculated for arsenic. Site-wide arsenic concentrations were compared to this number and the results of this comparison are shown on Figure 26. Only seven locations, five in the Northern Area, one in the Central Processing Area (sample location V19), and two in the Truck Wash Area (sample locations Y17 and Z16,17), exceeded the arsenic background concentration.

Mercury was widely detected in soil samples across the Site at concentrations above its RBTC (Figure 28). However, the pattern suggests that mercury may be at an elevated background concentration and not specifically present as a contaminant.

#### 8.1.5 *Polychlorinated Biphenyls*

Four PCB congeners (Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260) were detected in Site soil samples. Aroclor-1242 was only detected once and the detected concentration of 0.335 mg/kg is below the PCB RBTC of 0.83 mg/kg. Aroclor-1248 was detected in 19 of 112 soil samples at concentrations ranging from 0.0896 mg/kg to 161 mg/kg and detected concentrations exceeded the RBTC of 0.83 mg/kg in 10 samples (Figure 29). As shown on Figure 29, most of the detections occurred in the southern portion of the Northern Area, the Central Processing Area the Tank Farm Q area and were within the range of 10 to 100 times the RBTC. However, two locations, one in the southern portion of the Northern Area and one in the Tank Farm Q area exceeded 100 times the RBTC. Aroclor-1254 was the most

frequently detected PCB congener in 41 of 112 soil samples at concentrations ranging from 0.0557 mg/kg to 490 mg/kg and detected concentrations exceeded the RBTC of 0.83 mg/kg in 13 samples (Figure 30). The majority of the exceedances were in the range of 10 to 100 times the RBTC and primarily occurred in the Northern Area. However, two locations in the Northern Area exceeded 100 times the RBTC. Aroclor-1260 was detected in 35 of 112 soil samples at concentrations ranging from 0.0225 mg/kg to 16.6 mg/kg and detected concentrations exceeded the RBTC of 0.83 mg/kg in eight samples (Figure 31). The majority of the detections occurred in the Northern Area and were between 10 and 100 times the RBTC.

PCB impacts above the RBTC are limited to the southwestern portion of the Northern Area, the northwestern portion and former tank farm I and J area of the Central Processing Area, and between former Tank Farm Q and the West Storage Building #2 in the Western Area.

#### 8.1.6 Pesticides

Six pesticides (chlordane, 4,4-DDD, 4,4-DDE, 4,4-DDT, dieldrin, and endosulfan) were detected in Site soil samples. The most frequently detected pesticide was 4,4-DDE which was detected in 15 of 100 soil samples. None of the detected pesticides exceeded their respective RBTCs.

## 8.2 Groundwater

Grab groundwater samples were collected from eight locations in the Panhandle and Eastern area (Figure 3). At five locations (R25, KK23, NN26, KK26, and EE26), grab groundwater samples were collected from first encountered groundwater, encountered at approximately six feet bgs. At three of the locations (AA27, GG27, and MM27), three depth discrete grab groundwater samples were collected from each location. The shallow sample from each location was collected at 14 or 15 feet bgs, the intermediate depth sample was collected at 41 or 46 feet bgs and the deep sample was collected at 60 or 69 feet bgs. Therefore, a total of 14 grab groundwater samples were collected.

The groundwater samples collected from first encountered groundwater in borings R25, KK23, NN26, KK26, and EE26, and from 14 or 15 feet bgs in borings AA27, GG27, and MM27 are considered to be from the A water bearing zone. Deeper groundwater samples (41 to 46 feet bgs and 60 or 69 feet bgs) collected from borings AA27, GG27, and MM27 are from the B and C water bearing zones, respectively.

All grab groundwater samples were analyzed for VOCs; however, only samples R25-GW, EE26-GW, and KK26-GW were analyzed for petroleum hydrocarbon constituents (GRO, DRO, and MORO), SVOCs, PCBs and Pesticides. As for metals, samples R25-GW, EE26-GW, and KK26-GW were analyzed for the full suite of metals and additionally, samples KK23-GW and NN26-GW were analyzed for cadmium, total chromium and lead.

The groundwater analytical data are discussed below by water bearing zone and further subdivided by chemical group.

### 8.2.1 A Zone Grab Groundwater Samples

A summary of the detections in the A water bearing zone is presented below. Eight grab groundwater samples were collected from the A zone.

#### 8.2.1.1 Volatile Organic Compounds

Each groundwater sample collected during this investigation was analyzed for VOCs. Fifteen chemical constituents were detected in the samples submitted for laboratory analysis; however, of the 11 detected constituents with RBTCs (acetone, benzene, chlorobenzene, 1,1-DCA, 1,1-DCE, 1,2-DCA, trans-1,2-DCE, MTBE, 1,1,2-TCA, TCE, and vinyl chloride), none of the detections exceeded their respective RBTCs. The three constituents detected that do not have RBTCs are discussed below and the detected concentrations are compared to Federal Maximum Contaminant Levels (MCLs). If MCLs are not available, the detected concentration is compared to USEPA Regional Screening Levels (RSLs). VOC data for groundwater is presented in Table 8.

- Di-isopropyl ether was detected in two grab groundwater samples (R25-GW and MM27-15) at concentrations of 0.65 µg/L and 0.82 µg/L. Neither concentration exceeded the RSL of 1,500 µg/L.
- Cis-1,2-DCE was detected in five grab groundwater samples at concentrations ranging from 1.7 µg/L (MM27-15) to 60.9 µg/L (R25-GW). The detected concentrations in samples AA17-14 (11.3 µg/L) and R25-GW (60.9 µg/L) exceeded the California MCL of 6 µg/L.
- Tertiary butyl alcohol (TBA) was detected in one grab groundwater sample (R25-GW) at 5.7 µg/L. There is no California MCL or RSL for TBA.

#### 8.2.1.2 Petroleum Hydrocarbons

Only samples R25-GW, EE26-GW, and KK26-GW were analyzed for petroleum hydrocarbons. GRO was detected at very low concentrations (just above the laboratory MDL) in samples R25-GW (0.0616 µg/L) and EE26-GW (0.0422 µg/L). DRO was detected just above the laboratory MDL at 0.0590 µg/L in sample R25-GW.

#### 8.2.1.3 Semi-Volatile Organic Compounds

Three grab groundwater samples (R25-GW, EE26-GW, and KK26-GW) were analyzed for SVOCs. No SVOCs were detected in these three samples.

#### 8.2.1.4 Metals

Samples R25-GW, EE26-GW, and KK26-GW were analyzed for total CAM 17 metals. In addition, samples KK23-GW and NN26-GW were analyzed for total cadmium, chromium and

lead. Total metals are a measure of the metals sorbed to soil particles in a sample as well as metals dissolved in water. As such, concentrations of total metals are commonly higher than dissolved metals. Arsenic, barium, cadmium, total chromium, cobalt, copper, lead, mercury, molybdenum, nickel, silver, vanadium, and zinc were detected in almost every sample collected. Antimony, beryllium, and thallium were not detected in any sample. The detected concentrations are presented in Table 10.

#### 8.2.1.5 Pesticides and PCBs

Three grab ground water samples (R25-GW, EE26-GW, and KK26-GW) were analyzed for pesticides and PCBs. No pesticides or PCBs were detected in these three samples.

#### *8.2.2 B Zone Grab Groundwater Samples*

Three grab groundwater samples were collected from the B-zone. The B-zone grab groundwater samples were only analyzed for VOCs. Only 1,2-DCA was detected in sample GG27-GW-41 and only 1,2-DCA and 1,1,2-TCA were detected in sample AA27-GW-46. The detected concentrations are well below the established RBTCs for these compounds. No other VOCs were detected in B-zone grab groundwater samples.

#### *8.2.3 C Zone Grab Groundwater Samples*

Three grab groundwater samples were collected from the C-zone. Like the B-zone samples, the C-zone grab groundwater samples were only analyzed for VOCs. VOCs were not detected in sample GG27-GW-61. In sample AA27-GW-69, only low concentrations of acetone, 1,2-DCA, cis-1,2-DCE, trans-1,2-DCE, 2-butanone, 1,1,2-TCA and TCE. These detected concentrations are well below RBTCs or other applicable screening criteria. In sample MM27-GW-60, only a very low concentration, well below the RBTC, of chlorobenzene was detected.

#### *8.2.4 Groundwater Summary*

Grab groundwater samples were collected at various locations within the Panhandle and Eastern Area of the Site since a limited groundwater data was available for the southeastern portion of this area. VOCs were detected in many of the grab groundwater samples collected from the A-zone samples; however, all of the concentrations were below the RBTCs developed. Cis-1,2-DCE does not have an RBTC and the detected concentrations in samples AA17-14 and R25-GW exceeded the California MCL of 6 µg/L. In addition, various total metals were detected in the A-zone samples. Very low concentrations of select VOCs were detected in some B and C-zone samples; however, none of the concentrations exceed the RBTCs develop or other applicable screening criteria. In general groundwater in the southeastern portion of the Panhandle and Eastern are does not appear adversely impacted.

## 9.0 CONCLUSIONS

This section presents the soil, groundwater, and soil vapor conclusions based on results from the CSAP investigation. The investigation activities successfully achieved the goals and objectives established in the CSAP. A total of 160 borings were drilled on a 30-foot grid in the permitted locations and 90-foot grid for the remainder of the Site. A total of 479 primary and duplicate soil samples were collected and analyzed for a range of constituents. In total, over 1,186 unique chemical analyses were performed. In addition, 14 supplemental grab groundwater samples were collected and analyzed. Seventeen soil vapor borings were also sampled and analyzed, with the majority in proximity to buried utility corridors. Based on the program and findings of this investigation, the extent of impacts have been adequately defined.

The former Romic Environmental Technologies Facility has a long history of industrial uses, and the results of the CSAP investigation suggest that each past use has contributed to the currently impacted state of the Site. Early recycling and processing of liquid wastes by prior ownership appears to have led to releases in the Central Processing Area that adversely impacted soil and groundwater. In addition, the past practice of disposing process sludge and soil wastes in the former waste ponds, located at the north end of the Site, during the same period has impacted saturated soil and groundwater in the Northern Area. Subsequently, when the former waste ponds were filled to raise the surface elevation, chemically-impacted soil appears to have been used as part or all of the fill. It had been reported anecdotally that the former pond area was backfilled with rock and concrete debris as well as soil. Based on the drilling program findings, it now appears that the majority of the fill is mixed soil rather than large debris. In addition to the former activities in the Central Processing Area and the ponds in the Northern Area, it appears that former activities in the Tank Farm Q Area in the Western Area, have also led to releases that have impacted soil and groundwater. Together, these three early operational areas constitute the most impacted portions of the Site.

Past acquisition of adjacent wrecking yard properties around the perimeter of the original facility property raised a concern that past auto wrecking practices might have adversely impacted soil and possibly groundwater in these areas. To address this concern, a subset of auto wrecking yard chemical compounds was added to the CSAP program. Analysis of samples collected for this program suggests that a wrecking yard “signature” is not evident in the pattern and concentrations of compounds and metals detected in the former auto wrecking yard areas.

A range of halogenated and aromatic VOCs were detected in soil samples across large portions of the Site. The distribution of VOC detections was generally consistent with historical soil sampling and groundwater monitoring data. The area with the highest number of RBTC exceedances and greatest density of elevated VOC chemical detections was in the former Pond Area. The second area was the former Central Processing Area/Tank Farm Q area. The difference between the two most impacted areas is the thickness of unsaturated soil. While the fill in the former Pond Area is nearly ten feet thick and situated above groundwater, the concrete foundations in the former Central Processing Area and Tank Farm Q appear to extend down into

groundwater across much of the area. The lack of unsaturated soil in Tank Farm Q in the Western Area and the central portion of the Central Processing Area should be considered in developing the Corrective Measures program.

Soil vapor sampling along subsurface utility corridors has demonstrated that the utility corridors are not acting as a pathway for VOC vapors.

The remainder of the Site had few to no detections of VOCs in soil at concentrations above the RBTCs. With the exception of a few, isolated detections of TCE at the former location of the maintenance building and elsewhere, the entire southern third of the Site is not impacted with VOCs above the RBTCs.

Of the target list of metals analyzed for in the soil sampling program, only lead, arsenic, and mercury were detected in soil samples at concentrations above their respective RBTCs or calculated background concentration (arsenic only). Elevated lead detections were predominantly associated with fill in the former pond area, suggesting that lead is less associated with Facility use history and more a source of the fill materials. Arsenic and mercury detections were also predominantly related to the former pond area fill, although each metal was also detected above their respective calculated background concentration or RBTC across much of the Facility. This pattern, especially for mercury, suggests that both metals are present regionally in soil.

PCBs were detected in soil at relatively low concentrations above and below the respective RBTC in deeper samples collected in the northwest section of the Site. These soil detections are consistent with groundwater monitoring data for the same area, suggesting a historical source or release of PCBs in soil prior to filling the area.

Of the limited SVOCs compounds detected in soil during the investigation, naphthalene was the only compound detected above its respective RBTC. The one exception was the single sample KK26, collected from the southern portion of the Panhandle and Eastern Area. KK26 had reported concentrations of a range of PAHs, suggesting that a limited release may have occurred in that area. Since the majority of PAH detections coincided with detections of higher boiling point petroleum hydrocarbons, it is probable that the KK26 sample was collected in a petroleum hydrocarbon impact area. Resampling or confirmation sampling should be considered during redevelopment in this area.

Besides naphthalene, the other PAHs were rarely detected in soil. For example, most PAHs were detected in the single soil sample KK26. However, though PAHs were infrequently detected, many of the laboratory reporting limits for PAHs were elevated. The detected PAHs, in general, are coincident with detections of petroleum hydrocarbons and may be related to petroleum hydrocarbon products.

Pesticides were detected infrequently in soil and each detection was below the respective RBTC. These data indicate that pesticides are not a risk or issue for redevelopment at the Site.

Grab groundwater samples were collected at various locations within the Panhandle and Eastern Area of the Site since a limited groundwater data was available for the southeastern portion of this area. VOCs were detected in many of the grab groundwater samples collected from the A-zone samples; however, all of the concentrations are below the RBTCs developed. Cis-1,2-DCE does not have an RBTC and the detected concentrations in samples AA17-14 and R25-GW exceeded the California MCL of 6 µg/L. In addition, various total metals were detected in the A-zone samples. Very low concentrations of select VOCs were detected in some B and C-zone samples; however, none of the concentrations exceed the RBTCs develop or other applicable screening criteria. In general groundwater in the southeastern portion of the Panhandle and Eastern are does not appear adversely impacted.

The overall distribution of chemicals in soil and groundwater at the Site is consistent with previous conceptual models for the Site, with the exception of the former Pond Area fill that is more impacted than previously interpreted from past sampling. The basis for this conclusion is through comparison between the limited historical dataset and the data collected for the CSAP program. Relative concentrations, RBTC exceedances, and chemical diversity each decrease south of the former Pond Area, and essentially decrease to below all respective RBTCs south of the former Laboratory Building (coordinate line "W").

## 10.0 RECOMMENDATIONS

The CSAP investigation program has been completed and the findings are considered adequate to support design of the Corrective Measures program and to evaluate the appropriate mitigation measures to achieve the goals stated in the Record of Decision (ROD) (USEPA 2008). As discussed elsewhere in this report, comparison of soil and soil vapor data to their respective RBTCs identified areas in the southern portions of the Site that are below or nearly below all RBTCs. In contrast, the entirety of the former Pond Area (“Northern Area”) and former Production Area (“Central Processing Area”) soils have been found to be impacted with contaminants essentially from the concrete pavement down to the groundwater interface.

Based on these findings, it is recommended that future corrective measures for the former Romic facility be adjusted to optimize mitigation to match the degree of impact. Evaluation of analytical data and Site conditions encountered during the CSAP investigation suggests that corrective measures should include:

- Administratively reclassifying the southern sections of the Site where RBTCs are met or rarely exceeded in order to advance redevelopment of the property as deemed appropriate.
- An assessment of whether the Enhanced Reductive Dechlorination (ERD) bioremediation program currently at pilot scale for groundwater remediation can be expanded to remediate the shallow, partially saturated soils that underlay concrete foundations in the Central Processing Area.
- An alternative mitigation approach that avoids extensive soil excavation and off-site disposal in the former Pond Area to limit impacts to the community during excavation and transport. Alternatives that integrate insitu remediation technologies with the biological ERD groundwater program are recommended.

Future redevelopment or future investigation efforts should incorporate the following additional sampling to further test the conclusions of the CSAP investigation:

- Confirmatory soil and soil vapor sampling in the area of the former maintenance building to assess the extent of PCE detected in soil borings at this location. Data will be helpful for future redevelopment planning in the area, and to assess whether vapor migration issues may exist.
- Confirmatory soil sampling in the area of sample KK26 located near the Site entrance gate, to assess the extent of elevated PAHs and petroleum hydrocarbons detected in KK26.
- Final confirmatory soil vapor sampling in areas administratively reclassified for future redevelopment.

- Any future soil sampling should be structured to reflect the common elevated laboratory method detection limits due to matrix interference and elevated concentrations of chemicals.

**Notes:**

Shaded sample indicates location in historical auto wrecking operations area.

(1) "VOCs" indicates volatile compounds by USEPA method 8260B.

"CAM 17 Metals" indicates analyses of 17 metals by USEPA method 6010B, and mercury by USEPA Method 7470A Modified.

"Metals (Pb, Cd, Cr)" indicates lead, cadmium, and chromium by USEPA method 6010B.

"TPH" indicates total petroleum hydrocarbons as gasoline, diesel, and motor oil by modified USEPA method 8015.

"SVOCs" indicates semivolatile organic compounds by USEPA method 8270.

"Pesticides" indicates organochlorine pesticides by USEPA method 8081A.

"PCBs" indicates polychlorinated biphenyls by USEPA method 8082.

(2) "Sample Depths" indicates below ground surface. Most soil samples taken throughout the Site will initially be obtained from the shallowest first contact with soil (not gravel) below the concrete cover. Where a concrete cover is not present, analyses will be conducted on soil samples taken from the 0 to 0.5 foot interval below ground surface.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)   Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)   Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)  Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)   Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)   Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)   Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)   Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)   Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)   Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)   Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - B Indicates analyte found in associated method blank.
    - E Indicates value exceeds calibration range.
  - (3)  Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Volatile Organic Compounds (VOCs) analyzed using USEPA Method 8260B.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - B Indicates analyte found in associated method blank.
  - E Indicates value exceeds calibration range.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Petroleum Hydrocarbons analyzed using USEPA Method 8015B and 8015B M.  
 GRO Gasoline Range Organics  
 DRO Diesel Range Organics  
 MORO Motor Oil Range Organics
- (2) Laboratory data qualifiers are as follows.  
 J Indicates an estimated value.
- (3) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (4) Sampling depths reported in feet below ground surface (feet bgs).
- (5) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Metals analyzed using USEPA Method 6010B and 7471A.
- (2) Laboratory data qualifiers are as follows.  
 J Indicates an estimated value.
- (3)   Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the laboratory reporting limit.
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- (7) Calculated background concentration.
- Not applicable / not analyzed.

Notes:

- (1) Semi-Volatile Organic Compounds (SVOCs) analyzed using USEPA Method 8270C.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - R Indicates the result is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Semi-Volatile Organic Compounds (SVOCs) analyzed using USEPA Method 8270C.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - R Indicates the result is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Semi-Volatile Organic Compounds (SVOCs) analyzed using USEPA Method 8270C.
  - (2) Laboratory data qualifiers are as follows.
    - J Indicates an estimated value.
    - R Indicates the result is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
  - (3)  Indicates an exceedance of the RBTC.
  - (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
  - (5) Sampling depths reported in feet below ground surface (feet bgs).
  - (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Semi-Volatile Organic Compounds (SVOCs) analyzed using USEPA Method 8270C.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - R Indicates the result is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Semi-Volatile Organic Compounds (SVOCs) analyzed using USEPA Method 8270C.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - R Indicates the result is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Semi-Volatile Organic Compounds (SVOCs) analyzed using USEPA Method 8270C.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - R Indicates the result is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Semi-Volatile Organic Compounds (SVOCs) analyzed using USEPA Method 8270C.
- (2) Laboratory data qualifiers are as follows.
  - J Indicates an estimated value.
  - R Indicates the result is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
- (3)  Indicates an exceedance of the RBTC.
- (4) Bold font indicates a concentration detected at or above the method detection limit (MDL).
- (5) Sampling depths reported in feet below ground surface (feet bgs).
- (6) Sample is a field duplicate.
- Not applicable / not analyzed.

Notes:

- (1) Samples collected by Iris Environmental and analyzed by Air Toxics Ltd. of Folsom, California for VOCs using Modified TO-15.
- (2) Sampling depths reported in feet below ground surface.
- (3) **Bold font** indicates a concentration detected at or above the laboratory reporting limit.
- (4) Sampling depths reported in feet below ground surface.

Abbreviations:

RBTC = risk-based target concentration

Indicates an exceedance of the RBTC.

VOCs = volatile organic compounds

Notes

(1) Arsenic data set with non-detects and outliers removed.

Abbreviations

bgs = feet below ground surface  
 mg/kg = milligrams per kilogram

Z27	1.0	–	2	4	–
	3.5	–	–	–	–
	6.5	–	–	–	–

Notes

- (1) Numerical values represent the number of individual chemical method detection limits within each analytical group that exceed the individual chemical RBTC.
  - (2) Exceedance counts include primary and duplicate samples, if applicable.
  - (3) Volatile Organic Compounds (VOCs) analyzed by USEPA Method 8260B.
  - (4) Semi-Volatile Organic Compounds (SVOCs) analyzed by USEPA Method 8270C.
  - (5) Pesticides analyzed by USEPA Method 8081A.
  - (6) Polychlorinated Biphenyls (PCBs) analyzed by USEPA Method 8082.
  - (7) ft bgs = feet below ground surface
- No method detection limits exceed RBTC values, if applicable.

## **5.0 Sampling Procedures**

General field operations, practices, specific sample collection, and inventory procedures must be carefully planned and implemented to ensure that the data collected in an environmental study are of the highest quality. This section of the CSAP describes pre-field activities and sampling procedures that will be followed for all media so this goal may be achieved. Additionally, QA/QC procedures (Appendix A), field documentation forms (Appendix C), and standard operating procedures (SOPs) (Appendix D) will be used to help meet all DQOs for the investigation.

### **5.1 Field Preparation**

#### **5.1.1 Health and Safety**

Prior to initiating field activities, a Site-specific Health and Safety Plan (HASP) will be prepared in accordance with the Occupational Safety and Health Administration "Hazardous Waste Operations and Emergency Response" guidelines (29 Code of Federal Regulations 1910.120) to address potential hazards. The work outlined in this CSAP is a phased approach which will require various field activities performed by numerous workers. Prior to the initiation of field work the HASP will be reviewed and signed by all field personnel.

#### **5.1.2 Subsurface Utility Clearance**

Underground Service Alert (USA) will be contacted at least 48 hours prior to any subsurface work. Additionally, an underground utility locator will be subcontracted prior to the initiation of field activities, to identify possible subsurface obstructions and utilities adjacent to proposed drilling or excavation locations.

Soil boring locations situated in areas covered in concrete will be cored by a concrete coring service or concrete breaker prior to drilling activities. Because subsurface investigation will be conducted after the facility has been decommissioned, there should be no live feeds to the Site, and therefore no safety considerations warranting hand-auger drilling methods.

#### **5.1.3 Permitting**

Prior to advancing soil borings, required permits will be obtained from the San Mateo County Environmental Health Department.

### **5.2 Sample Collection Methods**

The following section provides a description of the sample collection methods that will be used during implementation of the Site CSAP. Field documentation forms that will be used during the investigation are presented in Appendix C. Appendix D presents the SOPs for the following

field investigation methods:

- Soil drilling and sample collection;
- Groundwater sampling using hydropunch;
- Soil vapor sampling; and
- CPT.

### **5.2.1 Direct Push Drilling**

Direct push drilling methods, such as Geoprobe®, will be used to collect subsurface lithology samples and soil samples for laboratory analysis. Shallow grab groundwater samples will also be collected during direct push drilling activities. Direct push-drilling methods use hydraulic pressure and the weight of the drill rig to advance drill rods into the subsurface. This drilling method is invasive but can be performed quickly while generating relatively little waste.

Rods containing clear acetate liners approximately 2 inches in diameter and 4 feet long will be driven to the desired depth. The rods will be retracted, and the acetate liners will be removed for lithologic logging. Soil will be logged using the unified soil classification system (USCS). Soil samples will be collected using an EnCore™ sampler from the desired sampling depth (three EnCores™ per sample). After soil samples have been collected the soil borings will be sealed to grade (freefall) using neat cement grout. All soil borings will be completed under the supervision of a California Professional Geologist.

Grab groundwater samples will be collected by placing a temporary poly vinyl chloride (PVC) well casing and screen into the borehole once the target depth has been reached. The water column will be allowed to stabilize for at least 30 minutes prior to sample collection. Grab groundwater samples will be collected using a pre-cleaned bailer. Once the grab groundwater sample has been collected, the PVC will be removed and the borehole will be abandoned in the same manner as the soil borings.

Additional soil samples may be collected at the discretion of the field geologist, based on Site conditions and signs of contamination and/or PID measurements. If free-phase product is encountered during the Geoprobe® investigation, temporary PVC well casing will be put in the borehole to allow free product to accumulate, and a well cap will be used to prevent off-gassing of VOCs. A temporary well screen will be placed above and below the water table once the water table has equilibrated, and the well will be sampled for the full suite of sample analyses: VOCs, metals, SVOCs, pesticides, PCBs, and TPH (gas, diesel, and motor oil).

All soil and groundwater grab sample containers will be labeled and stored in an ice-filled cooler chilled to 4 degrees Celsius (°C). The samples will be shipped or couriered under proper chain-of-custody protocol to a California State-certified laboratory for analysis.

Re: U.S. EPA Conditional Approval of Final Draft, Comprehensive Site-Wide  
Sampling and Analysis Plan and Approval of CSAP Schedule for Former Romic  
Facility, East Palo Alto, CA

Dear Mr. Alger,

The U.S. Environmental Protection Agency ("U.S. EPA") is conditionally approving the "Final Draft, Comprehensive Site-Wide Sampling and Analysis Plan, Former Romic Environmental Technologies Corporation Facility, 2081 Bay Road, East Palo Alto, California", dated March 30, 2011 ("CSAP"). U.S. EPA is also approving the CSAP implementation schedule dated June 9, 2011.

The U.S. EPA, California Environmental Protection Agency, Department of Toxic Substances Control ("DTSC"), and the California Regional Water Quality Control Board, San Francisco Bay Region ("RWQCB") (collectively referred to as the Joint Agencies) have evaluated the CSAP and found that it meets nearly all of our technical requirements. The remaining issues are minor and are addressed as conditions for the approval.

The approval for the CSAP is conditioned on Bay Enterprises ("BE") taking the following actions:

1. **Monthly Progress Reports.** Submit monthly progress reports to the Joint Agencies that identify the work completed during the month, describe significant findings and include any validated analytical data packages received from the laboratory. The progress reports shall also identify any obstacles which may prevent BE from implementing the CSAP in accordance with the June 9, 2011 schedule and what actions are or can be taken to overcome these obstacles. The progress reports can be submitted by email and shall be sent on or before the 15<sup>th</sup> day of the following month.

2. **Data Distribution Analysis.** Determine the appropriate statistical distribution for use in calculating the 95% Upper Confidence Limit ("UCL") for comparing data collected during the investigation to the Risk Based Target Concentrations (RBTCs). Section 2 of the report "Development of Risk-Based Target Concentrations" dated March 29, 2011 (see Appendix B of CSAP), indicates that the "arithmetic average" will be used for determining the UCL. The arithmetic average assumes a normal distribution for the data which may not be the case. The data must first be analyzed to determine how it is distributed (e.g., normal, log normal, etc.) before calculating the UCL.
3. **Reporting Limits.** Ensure that all of the laboratory reporting limits for analysis are below the media cleanup objectives contained in U.S. EPA's Final Remedy Decision (July 2008) and the site specific risk-based target concentrations ("RBTCs"). The discussion in Section 3.0, Project Data Quality Objectives, of the CSAP states that "All laboratory reporting limits for analysis will be below the media cleanup objectives contained in the Final Remedy Decision for the Former Romic Environmental Technologies Corporation Facility (US EPA 2008) and the Site-specific risk based target concentrations (RBTCs) provided in Appendix B." The laboratory reporting limits contained in Tables A1 through A3 of Appendix A of the CSAP are not fully consistent with this statement since they contain instances where the media cleanup objective and/or RBTC are below the laboratory reporting limit. For example, for methylene chloride in groundwater, the media cleanup objective is 0.005 mg/L and the reporting limit 0.02 mg/L.
4. **Most Current Analytical Test Methods.** Use the most current analytical test methods for the investigation. For example, the methods table on page 17-18 of the CSAP lists "8270" for SVOCs. The current version of U.S. EPA Method 8270 is 8270 D (Feb 2007).
5. **Soil Gas Sampling Method.** Use the installation and sampling methods for soil vapor discussed in Section 5.2.4.1 of the CSAP in lieu of the Standard Operating Procedures ("SOPs") in Appendix D since there some inconsistencies between the two sections. The SOPs for sampling soil vapor contained in Appendix D are also not consistent with the most recent DTSC Draft Advisory titled "Active Soil Gas Investigation, March 2010.

Please submit an addendum to the CSAP that documents how the conditions for approval have been addressed. The addendum shall be submitted to U.S. EPA within 30 calendar days of your receipt of this letter.

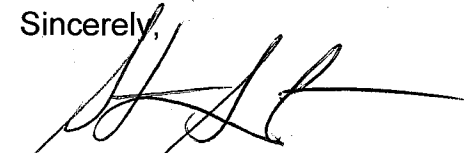

Additionally, the following operational information should be provided to U.S. EPA before the field work begins:

1. The name and certification type of the mobile laboratory that will be used for the soil gas analysis.
2. At least 14 calendar days advance written notice of the commencement of field work.

The CSAP implementation schedule sets out the timing for the key investigation tasks (e.g., soil sampling, data review and reporting). The implementation schedule begins on the date when the CSAP is approved by U.S. EPA (date of this letter) and sets forth the months when the different tasks will be undertaken and completed. Per the conditional approval of the CSAP provided in this letter, BE should immediately begin implementation of the CSAP in accordance with the June 9, 2011 schedule.

Corrective action at the former Romic facility is required pursuant to the Administrative Order on Consent U.S. EPA Docket No. RCRA-09-88-0015. The approved CSAP, future addendum, and June 9, 2011 implementation schedule are incorporated by reference into the Administrative Order on Consent. If you have any questions, please contact Ron Leach at (415) 972-3362. Thank you for your continued cooperation.

Sincerely,

A handwritten signature in black ink, appearing to read 'S. Armann', written over a horizontal line.

Steve Armann, Manager  
RCRA Corrective Action Office

### **Gregg Drilling CPT Report and Logs**

GREGG DRILLING & TESTING, INC.  
GEOTECHNICAL AND ENVIRONMENTAL INVESTIGATION SERVICES

January 25, 2012

Iris Environmental  
Attn: Chris Alger

Subject: CPT Site Investigation  
Former Romic Site, 2081 Bay Rd.  
Palo Alto, California  
GREGG Project Number: 12-012MA

Dear Mr. Alger:

The following report presents the results of GREGG Drilling & Testing's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	<input checked="" type="checkbox"/>
2	Pore Pressure Dissipation Tests	(PPD)	<input type="checkbox"/>
3	Seismic Cone Penetration Tests	(SCPTU)	<input type="checkbox"/>
4	UVOST Laser Induced Fluorescence	(UVOST)	<input type="checkbox"/>
5	Groundwater Sampling	(GWS)	<input checked="" type="checkbox"/>
6	Soil Sampling	(SS)	<input type="checkbox"/>
7	Vapor Sampling	(VS)	<input type="checkbox"/>
8	Pressuremeter Testing	(PMT)	<input type="checkbox"/>
9	Vane Shear Testing	(VST)	<input type="checkbox"/>
10	Dilatometer Testing	(DMT)	<input type="checkbox"/>

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (925) 313-5800.

Sincerely,  
GREGG Drilling & Testing, Inc.

Mary Walden  
Operations Manager

## **Appendix D**

### **Laboratory Analytical Reports**

30 September 2011

Mr. Chris Alger  
Iris Environmental  
1438 Webster Street, Suite 302  
Oakland, CA 94612

**SUBJECT: DATA REPORT - Iris Environmental Project # 07-555C**  
**2081 Bay Road, East Palo Alto, California**

**TEG Project # 10915E**

Mr. Alger:

Please find enclosed a data report for the samples analyzed from the above referenced project for Iris Environmental. The samples were analyzed on site in TEG's mobile laboratory. TEG conducted a total of 21 analyses on 21 soil vapor samples.

-- 21 analyses on soil vapors for selected volatile organic hydrocarbons by EPA method 8260B.

The results of the analyses are summarized in the enclosed tables. Applicable detection limits and calibration data are included in the tables.

1,1 difluoroethane was used as a leak check compound during the soil vapor sampling. No 1,1 difluoroethane was detected in any of the vapor samples reported at or above the DTSC recommended leak check compound reporting limit of 10 ug/L of vapor.

TEG appreciates the opportunity to have provided analytical services to Iris Environmental on this project. If you have any further questions relating to these data or report, please do not hesitate to contact us.

Sincerely,

Mark Jerpbak  
Director, TEG-Northern California

Project Name: Romic EPA  
Project #: 07-555C  
Workorder #: 1109339

Dear Ms. Anna Behrens

The following report includes the data for the above referenced project for sample(s) received on 9/19/2011 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori  
Project Manager

**LABORATORY NARRATIVE  
EPA Method TO-15  
Iris Environmental  
Workorder# 1109339**

Two 1 Liter Summa Canister samples were received on September 19, 2011. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

**Receiving Notes**

There were no receiving discrepancies.

**Analytical Notes**

The reported CCV for each daily batch may be derived from more than one analytical file due to the client's request for non-standard compounds.

Non-standard compounds may have different acceptance criteria than the standard TO-14A/TO-15 compound list as per contract or verbal agreement.

A dilution was performed on sample SG-2 due to the presence of high level target species.

**Definition of Data Qualifying Flags**

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV and/or LCS.

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

**Summary of Detected Compounds

CAS No.	Surrogate Recoveries	Run# 1	Run# 2	Limits
877-09-8	Tetrachloro-m-xylene	85%		35-132%
877-09-8	Tetrachloro-m-xylene	121%		35-132%
2051-24-3	Decachlorobiphenyl	106%		35-132%
2051-24-3	Decachlorobiphenyl	110%		35-132%

(a) All results reported on wet weight basis.

(b) Reporting limits raised due to high concentration of PCB (Aroclor 1260) and non-target Hydrocarbons.

(c) Result from signal#2.

ND = Not detected MDL - Method Detection Limit

RL = Reporting Limit

E = Indicates value exceeds calibration range

J = Indicates an estimated value

B = Indicates analyte found in associated method blank

N = Indicates presumptive evidence of a compound

<b>Project:</b> Romic Soil Investigation(Romic EPA) - 2081 Bay Road, East Palo Alto, CA		

Run #	File ID	DF	Analyzed	By	Prep Date	Prep Batch	Analytical Batch
Run #1	JK21210.D	1	07/23/11	TT	n/a	n/a	GJK878
Run #2							

Run #	Initial Weight
Run #1	5.21 g
Run #2	

**TPH Volatiles**

CAS No.	Compound	Result	RL	MDL	Units	Q
	TPH-GRO (C6-C10)	0.103	0.096	0.048	mg/kg	
CAS No.	Surrogate Recoveries	Run# 1	Run# 2	Limits		
98-08-8	aaa-Trifluorotoluene	90%		60-157%		

(a) All results reported on wet weight basis.

ND = Not detected      MDL - Method Detection Limit  
 RL = Reporting Limit  
 E = Indicates value exceeds calibration range

J = Indicates an estimated value  
 B = Indicates analyte found in associated method blank  
 N = Indicates presumptive evidence of a compound
