

MEMORANDUM

SUBJECT: CASAC Request for data associated with Appendix D of the document titled *Risk and Exposure Assessment for the Review of the Primary National Ambient Air Quality Standard for Sulfur Oxides*

FROM: Erika N. Sasser, Director
Health and Environmental Impacts Division
Office of Air Quality Planning and Standards
United States Environmental Protection Agency

TO: Aaron Yeow, Designated Federal Officer
Clean Air Scientific Advisory Committee
EPA Science Advisory Board Staff Office

At the September 18-19, 2017 public meeting of the Clean Air Scientific Advisory Committee (CASAC) Sulfur Oxides Panel review of the *Risk and Exposure Assessment for the Review of the Primary National Ambient Air Quality Standard for Sulfur Oxides, External Review Draft* (draft REA), a Panel member requested data associated with Appendix D of the document. The specific request was for a file with the 1-hour SO₂ concentrations for 2011, 2012 and 2013 from each of the seven monitors included in Appendix D and the modeled 1-hour SO₂ concentrations from each receptor at the location of the monitor (paired in time). Attached are data in response to this request.

The attached file contains the following:

- Description of abbreviated data headers
- 1-hour SO₂ concentrations observed for 2011, 2012, 2013 at monitor 250051004 in the Fall River Study area; monitors 180970057, 180970073, and 180970078 in the Indianapolis study area; and monitors 401430175, 401430235, 401431127 in the Tulsa Study area (monitor 401430179 had 2013 data only and was not used for the evaluation).
- 1-hour SO₂ concentrations estimated for 2011, 2012, 2013 at the monitor locations

Air quality modeling was used in the draft REA in light of the limited number of SO₂ ambient air monitors in each study area that are unlikely to adequately capture the spatial variation in concentrations, including the relatively higher concentrations in areas affected by large point sources. The American Meteorological Society/EPA regulatory model (AERMOD) was used given that SO₂ emissions to ambient air are dominated by point sources, such as large coal-fired utilities, and AERMOD is the EPA's preferred dispersion model for regulatory uses, including air quality modeling of SO₂ concentrations for State Implementation Plans (SIPs) and new source permitting purposes. AERMOD has a wide-ranging history of such use and extensive model performance evaluations with field study data that supported its establishment as EPA's preferred dispersion model in 2005 and its latest scientifically based update through final rulemaking in January 2017. As described in the draft REA, the hourly concentrations estimated by AERMOD are combined with ambient air monitor-based information of finer (5-minute)

temporal variability to estimate 5-minute concentrations, which are the basis for the exposure modeling that produces population exposure estimates for the three study areas. These 5-minute SO₂ concentrations were estimated by combining the annual pattern of 5-minute monitored concentrations with the annual pattern of hourly concentrations modeled at each receptor, based on matching the rank-ordered 1-hour concentration distributions.

The AERMOD output for the three study areas was evaluated in Appendix D, consistent with EPA's model evaluation protocol that focuses on the higher concentrations in the concentration distribution as those represent the concentrations of interest in regulatory applications. These concentrations are also generally most important for the exposure assessment performed in the draft REA. Given the uncertainty in emissions and meteorological inputs (e.g., wind direction) for a given hour, EPA's *Guideline on Air Quality Models* explicitly discourages pairing of model estimates and monitor data on an hour-by-hour basis in evaluating performance of air quality models. Appendix D recognized the uncertainties in available model inputs (i.e., emissions and meteorology) for the three urban study areas, as well as the limited spatial coverage provided by the seven monitors across the three study areas.

Given that the analyses in the draft REA involve a system of models, AERMOD model output should be considered in terms of how it is being used in the Air Pollutants Exposure model (APEX) to generate estimates of exposure as individuals move through time and space. In particular, in evaluating model outputs, it is important to consider whether predicted high values are occurring during times where people may be exercising in microenvironments where ambient SO₂ concentrations contribute to exposure. It is also appropriate to consider broad temporal patterns in hourly concentrations (e.g., seasonal, weekday/weekend, times-of-day), which may be more informative than comparing simultaneous hourly time-series of concentrations (e.g., model-to-monitor comparisons). Additionally, it may be useful to consider temporal patterns in concentrations at a collection of modeled receptors near the monitor site rather than relying solely on concentrations at a single receptor.

We look forward to receiving the CASAC comments on the draft documents, including those particular to the exposure and air quality modeling. In finalizing the REA, we will be making revisions to the draft documents with careful consideration of the CASAC comments.

CASAC Request for data associated with Appendix D of the document titled Risk and Exposure Assessment for the Review of the Primary National Ambient Air Quality Standard for Sulfur Oxides - DATA FILE

Column	description
site_id	Monitor site identifier
year	4-digit year
month	2-digit month
day	2-digit day
hour	hour
hour flag	Flag indicating whether AERMOD determines an hour is calm (C), missing (M), or valid (V). For hours that are calm (wind speed and wind direction = 0) or missing (key meteorological variables set to missing values in meteorological files), AERMOD does not calculate a concentration so the AERMOD concentration is denoted by -999.
AERMOD (ppb)	AERMOD hourly concentration in ppb
Obs (ppb)	Observed hourly concentration in ppb. Missing values denoted by -999.
wind speed (m/s)	Wind speed for hour
wind direction	Wind direction for hour

Fall River SO2 Concentrations
