

Parameterization of MOVES-based Onroad Mobile Emission Factors Lookup Tables in SMOKE

B.H. Baek, Carlie Coats and Rizzieri Pedruzzi

University of NC at Chapel Hill, USA

Background

- SMOKE-MOVES Integration Tool Released on 2010

- Enhanced the meteorology dependency on mobile emissions for air quality modeling system
- Technical Challenges:
 - Slow and Most Computationally Expensive!
 - Big size of ASCII-format MOVES Emissions Factors Lookup Table files
 - Processing the limited numbers of Reference County-specific Lookup Tables

SMOKE-MOVES Integration Tool

- **RatePerDistance** [grams/miles]
 - Exhaust and most evaporative emissions that happen on real roadtypes
 - Sorted By SCC (=vehicle/road/process), 16 Speed Bins and Ambient Temperature Bins
- **RatePerVehicle** [grams/vehicle/hour]
 - Exhaust and most evaporative emissions that occur off-network
 - Sorted By SCC, Hour of day and Ambient Temperature Bins
- **RatePerProfile** [grams/vehicle/hour]
 - Vapor venting evaporative emissions that occur off-network
 - Sorted By SCC, Hour of day and Min/Max Temperatures
- **RatePerHour** [grams/hour]
 - APU operation and extended idling processes
 - Sorted By SCC, Ambient Temperature

Current SMOKE-MOVES Integration Runs

- **304** Reference Counties for Continental U.S. Modeling Domains with Two Fuel Months per Each Reference County (Based on NEI 2014 Modeling Platform)
- **Size of MOVES Lookup Tables:**
 - **RPD: 85-150MB (66.7GB), RPV: 28-86MB (36GB), RPP: 15-50MB, PRH: Less than 1MB**
- Processing Optimization: Processing 7 consecutive days at a time.
 - Faster processing but requires more RAM memory
 - Processing 1 days at at time, much slower processing time
 - Tagging or source grouping options: much more memory and slower processing time
 - More Grid Cells and more reference counties = more memory and slower processing time

Sectors	Computing Time	RAM Memory Usages
RPD	4 hours	10-20 GB
RPV	1.5 hours	5-10 GB
RPP	30 minutes	< 1 GB
RPH	5 minutes	2 GB

Future Plans

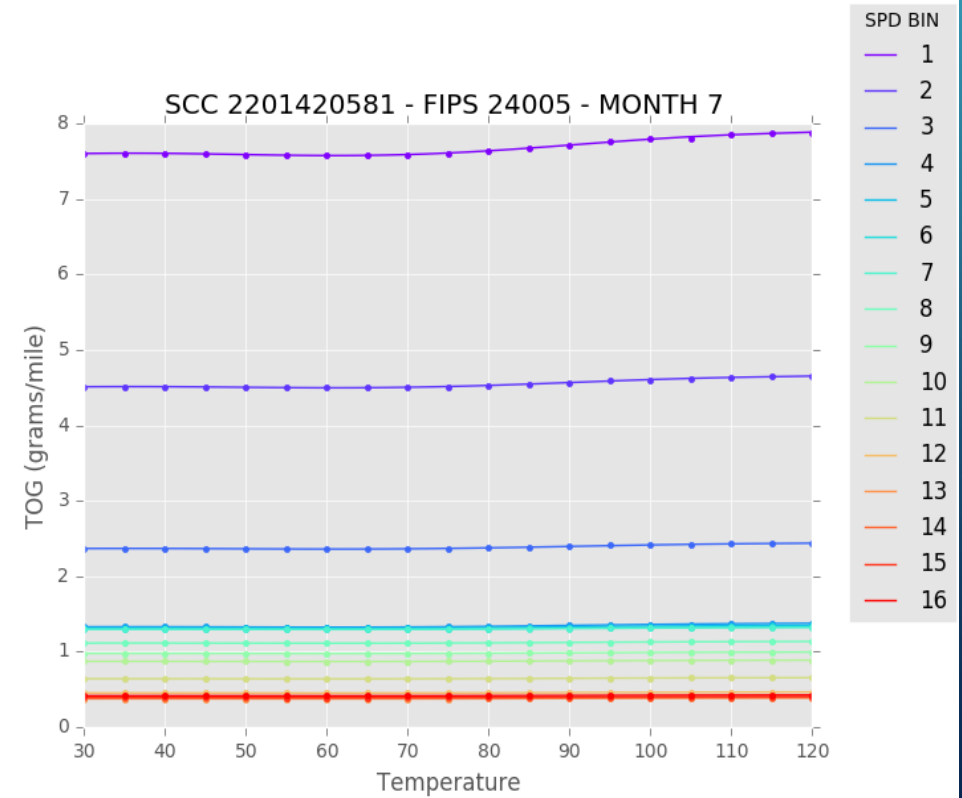

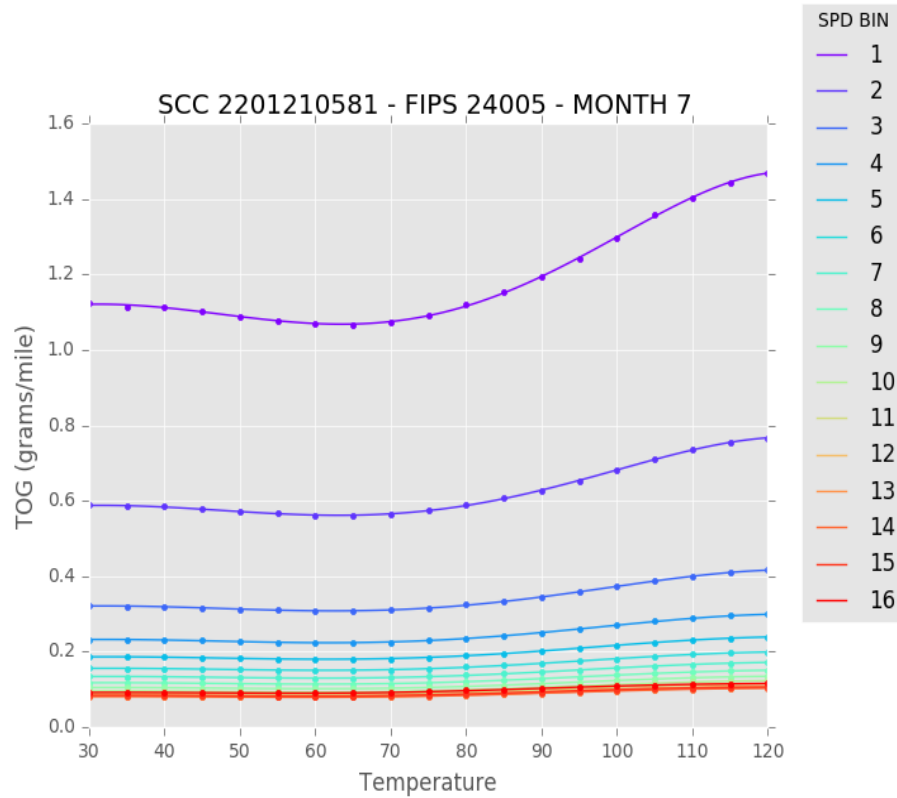

- Computational Optimization of the SMOKE-MOVES Integration tool
- Reduce the size and numbers of MOVES EF lookup tables:
 - Aggregated Processes (Less than 15 processes)
 - Aggregated Vehicle and Road Types
 - Reduced optimized temperature increments
 - Limited numbers of reference counties.
- Convert current ASCII-formatted MOVES EF lookup tables into NetCDF format

Proposed BCFA Method

- Parameterization of Current ASCII-format MOVES EF Lookup Tables into Polynomial Algorithms using **Best-Fitted Curve Algorithms (BFCA)** [**Done**]
- Store the algorithms in NetCDF format to eliminate I/O bottlenecks: [**Done**]
- Coupling with SMOKE [**Ongoing**]
- Coupling with AQ models including forecasting AQ [**2020**]

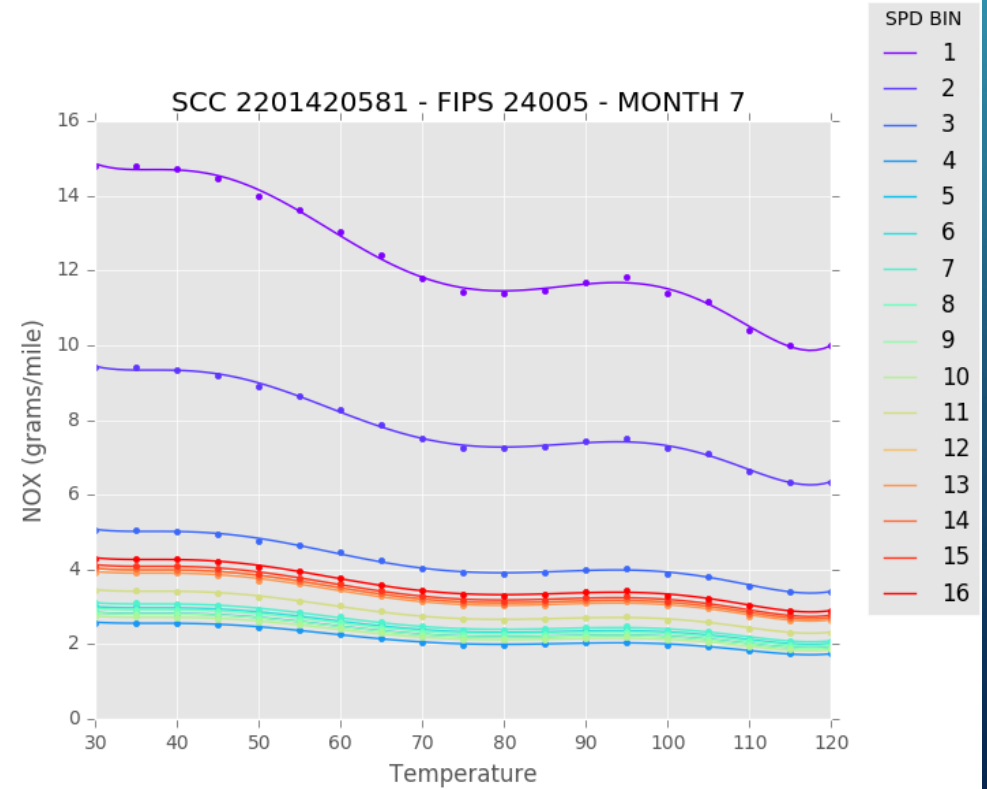

RPD TOG: Gasoline-Passenger Car(left) and Buses (Right)

Urban Unrestricted Access
All Exhaust, Evaporative, Brake and Tire [81]

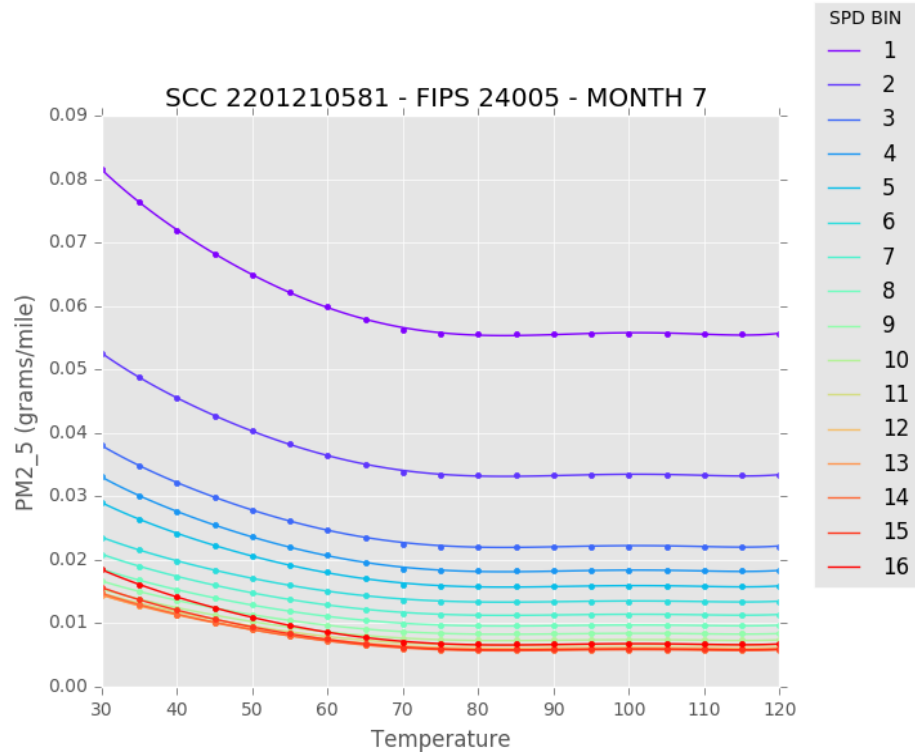

RPD NOx: Gasoline-Passenger Car(left) and Buses (Right)

Urban Unrestricted Access
All Exhaust, Evaporative, Brake and Tire [81]

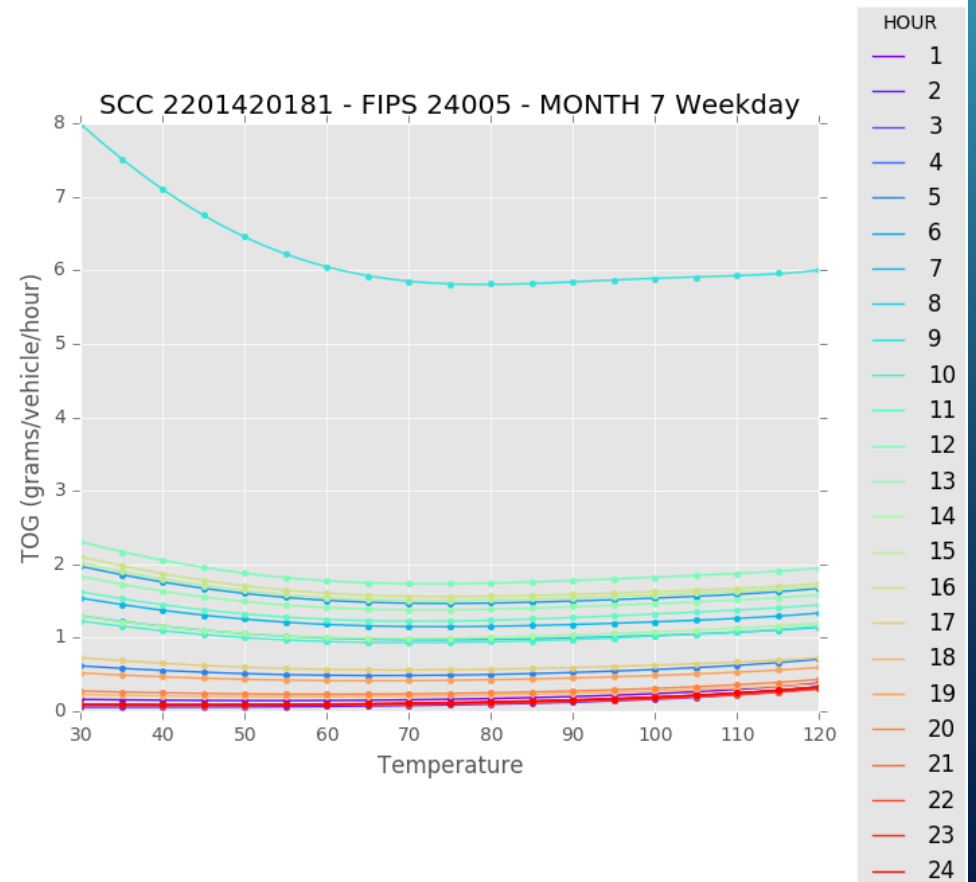

RPD PM_{2.5}: Gasoline-Passenger Car(left) and Buses (Right)

Urban Unrestricted Access
Refueling [62] and All Exhaust, Evaporative, Brake and Tire [81]

RPV TOG: Gasoline-Passenger Car(left) and Buses (Right)

Off-network
All Exhaust, Evaporative, Brake and Tire [81]

RPV NOx: Gasoline-Passenger Car(left) and Buses (Right)

Off-network
All Exhaust, Evaporative, Brake and Tire [81]

RPV PM_{2.5}: Gasoline-Passenger Car(left) and Buses (Right)

Off-network
All Exhaust, Evaporative, Brake and Tire [81]

Polynomial Algorithms Using BCFA Method

$$y = ax^6 + bx^5 + cx^4 + dx^3 + ex^2 + fx + g$$

MOVES BCFA NetCDF formatted Emissions Factors Lookup Table File:

- Days of Week = 7
- No of Pollutants : 30
- No of SCC : 320
- No of Speed Bin (for RPD) : 16 Bins
- No of Hours (for RPV and RPP) : 24 hours
- Minimum Temperature for all reference Counties
- Minimum Temperature for all reference Counties
- No of Polynomial Coefficients and intercept : 7 (a, b, c, d, e, f, and g)

Sectors	ASCII (MB)	CSV* (MB)	NetCDF* (MB)
RPD	95-150 (77*)	18	4.1
RPV	45-100 (55*)	11	2.1
RPH	<1MB (.65*)	0.11	0.04

Performances

- The size of NetCDF-format MOVES BCFA Lookup Table File : **~2.5G**
 - Two Fuel Months (i.e., January and July) for 304 Reference Counties
- Significant improvement on **SMOKE-MOVES** computational processing time and memory usages:
 - Small Test Case: US12km 66*59 Domain with a Single Reference County
 - ✓ Current: 15 Seconds vs. BCFA: 5 Seconds (**5 times Faster!**)
 - Med. Test Case: US12km 66*59 Domain with Two Reference Counties
 - ✓ Current: 509 Seconds vs. BCFA: 20 Seconds (**25 time Faster!**)
 - U.S. EPA NEI Modeling Platform Case: 12US1_459X299 with full Ref. Counties
 - ✓ Current: 4165 Seconds vs. BCFA: 49 Seconds (**85 times Faster!**)
- ❖ The more no of reference counties, the better speed up of SMOKE-MOVES
- ❖ MOVES BCFA Lookup table approach for Humidity Dependency?

Fully Coupled AQ Modeling System

Coupled Inline Emissions

1. Biogenic
2. NH₃ Bi-directional
3. Lightning NO_x
4. Sea salt
5. Windblown Dust
6. Plume Rise for Point sources
7. MOVES Mobile Sources

- ❖ Develop the prove of concept for coupling MOVES-based mobile emissions with air quality modeling system that can reflects the meteorology feedbacks to MOVES-based emissions for a better air quality simulation near metropolitan areas

A word cloud centered on the text "Q&A" in large white font. Surrounding it are various question words in different colors and sizes, including "Who?", "Where?", "When?", "How?", "What?", "Why?", "Where?", "When?", "How?", "What?", "Why?", "Where?", "When?", "How?", "What?", "Why?", "Where?", "When?", "How?", "What?", "Why?". The words are arranged in a circular pattern around the central "Q&A".
