Date: 4/13/2018

Subject: Review of Region 5 Data for Mid America Steel Drum, Inc.

To: Air Division, US EPA Region 5
77 West Jackson Boulevard
Chicago, IL 60605

From: Wayne Whipple, Chemist
US EPA Region 5 Chicago Regional Laboratory

The data transmitted under this cover memo successfully passed CRL's data review procedures as documented in the current Quality Management Plan and applicable Standard Operating Procedures. In accordance with the EPA QA/G-8 *Guidance on Environmental Data Verification and Data Validation* and the U.S. EPA Region 5 RMD QMP, CRL performs data verification on all the data generated internally. CRL does not perform data validation or quality assessment procedures.

This report was reviewed and the information provided herein accurately represents the analysis performed.

Analysis Case Narrative for Volatile Organic Compounds (VOC) Air Toxics

Wayne J. Whipple, Ph.D.

phone (312) 353-9063
email whipple.wayne@epa.gov

General Information:

A total of four 2.7 L canisters were received on 14 February, 2018 and 5 March 2018. They were logged in under work orders 1802002 and 1803001 respectively. One sample, 1802002-02 (sample 504) had arrived with the valve left open causing it to be cancelled for analysis (Qualtrax NCR 13821). The remaining canisters were received in good condition. All the remaining samples were analyzed within the 30 day holding time.

The samples were analyzed using the CRL SOP MS005 ver 2 with Pen and Ink 8327, 9436 and 9102 which allows for the use of the new Entech 7200 Preconcentrator and 7650 Robotic arm for sample analysis and an extended list of target compounds and clarifies a discrepancy between analytical and data review SOPs with the ICV recoveries.

The project objectives were to quantify target analytes and the presence of any other high concentration analytes detectable by this laboratory's SOP that is based on the TO-15 analysis. Data verification was performed and the data is acceptable to use for the purpose stated in the GMAP QAPP_v3.0_2016-05-13 Final Signed.

Preliminary results were sent on February 20, 2018 (1702002) and March 8, 2018(1803001). Detection and reporting limits along with data qualifiers have been changed and added to account for interferences found in the sample chromatograms and to allow reporting limits and detection limits to be reported for specific requested detection limits. The data is reported to the detection limits although the detection limits have been raised to match reporting limits for most of the compounds.

Sample Analysis and Results:

The 1802002-01 sample was analyzed in two different batches because many of the first batch (B18B006) calibration and calibration check compounds were out of tolerances along with having more concentrated sample monitoring compound results than expected. The second batch (B18C001) had better quality assurance and therefore data is reported from that batch with the exception of hexachlorobutadiene. The reporting limit in the first batch is lower and the first batch passed the QA/QC criteria for Hexachlorobutadiene. The other reporting limits for that sample had to be raised by a dilution factor of 2 because the sample needed to be diluted to an acceptable pressure to properly analyze the sample.

The data is reported to the lower 2.5 pptv detection limit for a subset of compounds to meet the requested lower risk thresholds. The other compound's detection and reporting limits were raised to 100 pptv to allow for more efficient reporting of blank interferences and calibration deviations. It would have been preferable to report most of the data to a 100 pptv reporting limit and the remaining lower detection limit compounds reported to their 2.5 pptv MDL but the data reporting software does not allow for compound specific reporting of detection and reporting limits within a specified analytical report. The data between the reporting and detection limit are flagged as estimated "J" for the subset of compounds with low detection limits as required by our QA/QC procedure although the data is believed to be of good quality based on the sample monitoring compounds and a few other compounds that are always present in samples in the Northern Hemisphere. Almost all the sample monitoring compounds and other compounds that have known background concentrations in the northern hemisphere like bromomethane, chloromethane and chloroform, are very close to the expected concentrations in the upwind samples and perform within acceptance criteria stated in the SOP. Details are in the

QC section.

Acrolein and acrylonitrile and 1,3-butadiene have major ions present but are believed to be influenced from coeluting non-target compounds and therefore are flagged as "MI", matrix interference and the detection levels have been raised to the concentration result for each compound because the spectra show significant interference.

Propene cannot be chromatographically or spectrally resolved from propane. Propane is present and therefore the result is estimated as propene + propane and flagged "J".

Quality Control:

The standard concentrations below the 100 pptv concentration will not pass acceptance criteria with the calibration method used and therefore most compounds have their reporting limit raised to the 100 pptv concentration except for the compounds that have lower risk concentrations (see email in data package). If the calibration curve was not forced through zero and the lowest 2.5 concentration level was not included almost every compound would pass all the calibration criteria but the sample monitoring compounds and few other compounds that are present in background air results would not be in the expected global background concentrations. These compounds include chloroform which is a requested compound. Therefore, it has been determined to use the curve fit that provided the most reliable results for the known concentrations of selected compounds. The compounds that have requested lower concentrations than the 100 pptv level have their detection levels kept at the 2.5 pptv concentration and if the values reported for these compounds are detected between the detection and reported limits there is an estimated qualifier in accordance with our QA/QC procedure.

The very low concentration detection limits result in considerable background contamination from the system as demonstrated by the method blank and the canister itself by the canister blank. If a sample result is within 5 times the method blank the sample is flagged for potential blank contamination "B". If the sample result is not flagged "B" and is within 5 times the blank canister result the result is qualified "BC" for a potential canister contamination.

Acetaldehyde did not pass the calibration criteria with severely nonlinear behavior and therefore was rejected.

Methanol and ethanol results were above the calibration curve in sample B18C001-DUP1. Additionally, **methanol and acetone** were above the calibration curve in sample 1803001-02. Therefore, the compounds are flagged "J" and "E" as estimated.

Acrolein and Acrylonitrile spectra cannot be resolved from interfering compounds that have similar ions. The concentration of these compounds can't be determined below the result reported in the sample causing the detection limits to be raised to the concentration reported because the interferences.

Many sample monitoring compounds have had their detection levels lowered to a result that allows them to be reported for data quality purposes. They still have an estimated qualifier on most, but it can be seen that most of the concentrations are within the expected ranges.

Notes and Definitions

R	Rejected
MI	Matrix interference
J	The identification of the analyte is acceptable; the reported value is an estimate.
B	Analyte concentration is < 5x that in the associated method blank(s); this concentration may be a high-bias estimate.
(E)	This analyte exceeded the calibration range
U	Not Detected
NR	Not Reported
Q	QC limit Exceeded
