

## GHGRP 2018: REPORTED DATA

### Greenhouse Gas Reporting Program Background

As directed by Congress, EPA’s Greenhouse Gas Reporting Program (GHGRP) collects annual greenhouse gas information from the top-emitting sectors of the U.S. economy (Table 1). The GHGRP is the only dataset containing facility-level greenhouse gas (GHG) emissions data from major industrial sources across the United States. With eight years of reporting for most sectors, GHGRP data provide important information on industrial emissions—showing variation in emissions within an industry, across geographic areas, and over time at the sector and facility level. EPA uses these data to improve estimates of national greenhouse gas emissions in the [U.S. Greenhouse Gas Inventory](#) and to inform regulatory actions and voluntary emission reduction efforts.

All emissions presented here reflect the most recent information reported to EPA as of 8/4/2019. The reported emissions exclude biogenic CO<sub>2</sub>. GHG data displayed here in units of carbon dioxide equivalent (CO<sub>2</sub>e) reflect the global warming potential (GWP) values from [Table A-1](#) of 40 CFR 98, which is generally based on the [IPCC AR4](#), with the addition of GWPs from the [IPCC AR5](#) fluorinated GHGs that did not have GWPs in the AR4.

This document summarizes national industrial sector emissions and trends.

**Table 1: GHGRP Sector Classifications**

The GHGRP does not represent total U.S. GHG emissions, but provides facility level data for large sources of direct emissions, thus including the majority of U.S. GHG emissions. The GHGRP data collected from direct emitters represent about half of all U.S. emissions. When including greenhouse gas information reported by suppliers to the GHGRP, emissions coverage reaches approximately 85-90% (See Figure 1). The [Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2017](#) contains information on all GHG emissions sources and sinks in the United States.

[Learn more about the differences between the Inventory and the GHGRP.](#)

**Figure 1: U.S. Greenhouse Gas Inventory and the Greenhouse Gas Reporting Program**  
**GHGRP Covers the Majority of U.S. GHG Emissions**

<sup>1</sup> Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2017. April 2019.

Suppliers report the quantity of GHGs that would be emitted if the fuels and industrial GHGs that they place into the economy each year are used/released. Emissions associated with these fuels and industrial gases do not occur at the supplier’s facility but instead occur throughout the country, wherever they are used. An example of this is gasoline, which is supplied into the U.S. economy by a relatively small number of entities and consumed by many individual vehicles throughout the country. The majority of GHG emissions associated with the transportation, residential, and commercial sectors are accounted for by these suppliers. This document focuses on data reported by direct emitters. Data reported by suppliers can be viewed through the [suppliers section](#) of the Facility Level Information on GreenHouse gases Tool ([FLIGHT](#)). [Learn more about suppliers and their 2018 reported data.](#)

**Table 2: Overview of GHG Data Reported (2018)**

<b>Direct emitters</b>	
Number of facilities that reported direct GHG emissions	7,655
Direct emissions reported (billion metric tons CO <sub>2</sub> e)	2.99
<b>Suppliers of fuel and industrial gases</b>	
Number of suppliers	951
<b>Carbon dioxide injection</b>	
Number of carbon dioxide injection facilities	95

## Who Reports?

For 2018, 7,655 direct emitters submitted a GHG report. The Petroleum and Natural Gas Systems sector had the largest number of reporting facilities, followed by the Waste sector and the Power Plants Sector. Among suppliers, Suppliers of Natural Gas and Natural Gas Liquids had the largest number of reporting facilities.

**Table 3: Number of Direct Emitters that Reported (2018)**

Industry Sector	Number of Reporters <sup>a</sup>
Power Plants	1,389
Petroleum and Natural Gas Systems	2,319
Refineries	140
Chemicals	457
Fluorinated Chemicals	16
Non-fluorinated Chemicals	441
Waste	1,498
Metals	304
Minerals	383
Pulp and Paper	218
Other	1,316
Underground Coal Mines	74
Electrical Equipment Production & Use	89
Electronics Manufacturing	49
Miscellaneous Combustion	1,104

<sup>a</sup> Totals sum to more than 7,655 because facilities with production processes in more than one sector are counted multiple times.

**Table 4: Number of Suppliers that Reported (2018)**

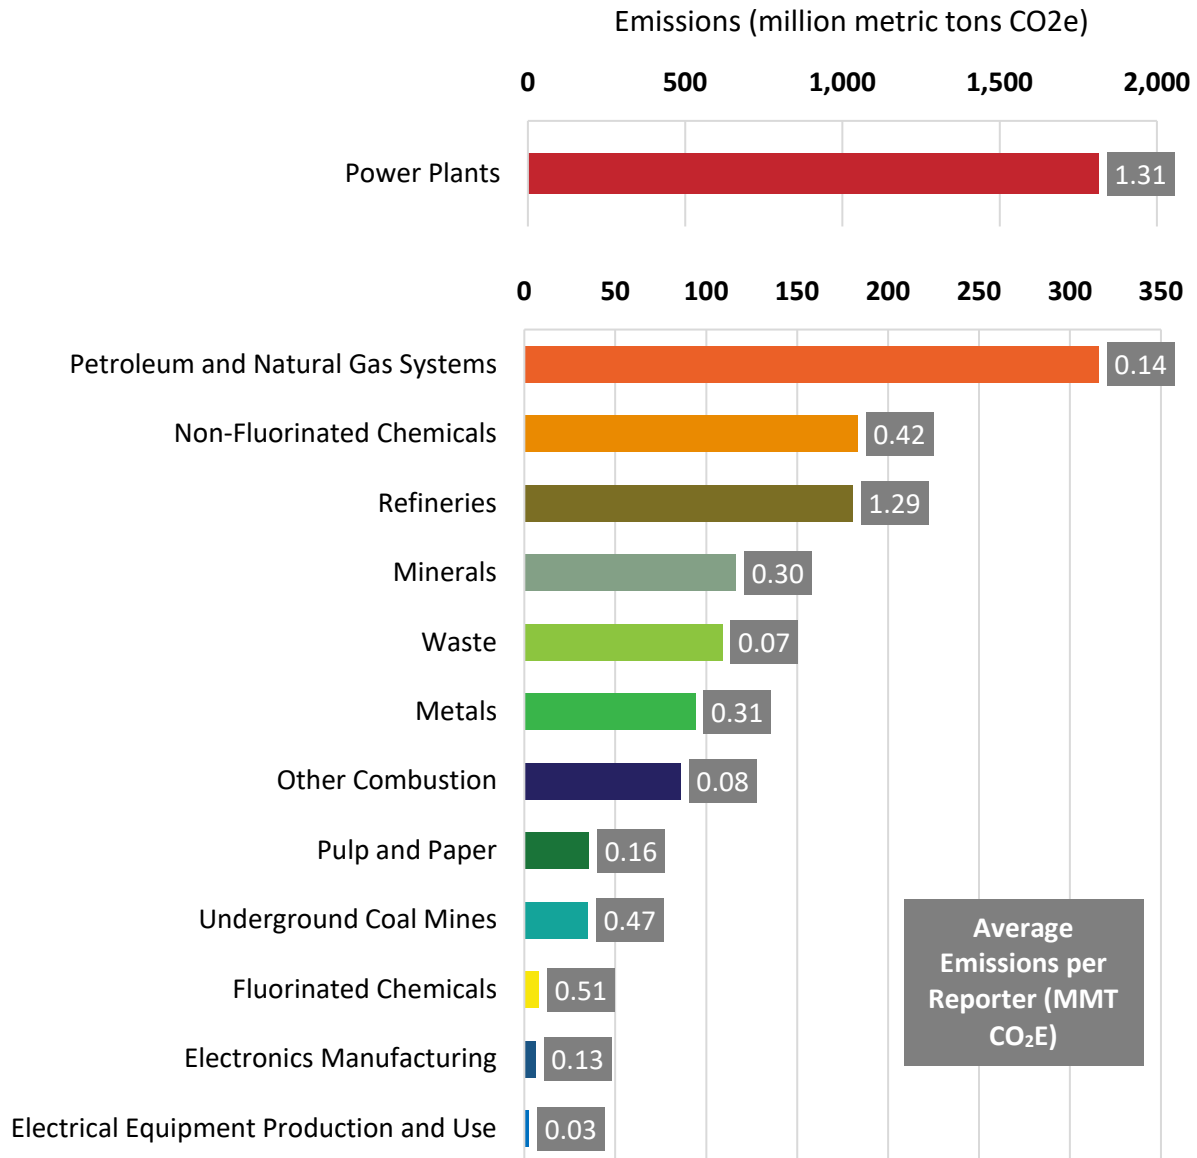

Supply Sector	Number of Reporters <sup>a</sup>
Suppliers of Coal-Based Liquid Fuels	1
Suppliers of Petroleum Products	226
Suppliers of Natural Gas and Natural Gas Liquids	
<i>Natural Gas Distribution</i>	375
<i>Natural Gas Liquids Fractionation</i>	124
Suppliers of Industrial GHGs and Products Containing GHGs	
<i>Industrial GHGs</i>	73
<i>Imports and Exports of Equipment Pre-charged with Fluorinated GHGs or Containing Fluorinated GHGs in Closed-cell Foams</i>	43
Suppliers of Carbon Dioxide	128

<sup>a</sup> Totals sum to more than 951 because suppliers that fall into more than one sector are counted multiple times.

### Reported Emissions

In 2018, 2.99 billion metric tons CO<sub>2</sub>e were reported by direct emitters. The largest emitting sector was the Power Plant Sector with 1.8 billion metric tons CO<sub>2</sub>e, followed by the Petroleum and Natural Gas Systems Sector with 316 million metric tons (MMT) CO<sub>2</sub>e and the Chemicals Sector with 191 MMT CO<sub>2</sub>e (non-fluorinated and fluorinated chemicals combined). This information, as well as average emissions per reporter, is shown in the following chart.

**Figure 2: GHG Emissions Reported by Sector (2018)**

[View this information in FLIGHT.](#)

## Emission Trends

National level trends in greenhouse gas emissions are available through the [Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2017](#) (April 2019). The GHGRP is different from the U.S. GHG inventory in that it collects information from the largest stationary sources in the U.S. and provides nearly complete emissions coverage for many of the largest emitting industries. Trends in emissions reported for individual industries are discussed in the industry-specific reports.

The U.S. GHG Inventory is not yet available for 2018. For sources reporting to the GHGRP, emissions decreased 2.2% from 2017 to 2018. Between 2011 and 2018, GHGRP-reported direct emissions (e.g. excluding suppliers) decreased 10.0%. This decline is primarily caused by the decline in reported emissions from power plants, which decreased 18.3% over the same period.

**Table 5: Emissions Trends for U.S. GHG Inventory and GHGRP (2011–2018)**

	2011	2012	2013	2014	2015	2016	2017	2018
<b>U.S. GHG Inventory<sup>a</sup></b>								
Total emissions (million metric tons CO <sub>2</sub> e)	6,787.4	6,456.0	6,710.2	6,760.0	6,623.8	6,492.3	6,456.7	Not available
Percent change in emissions from previous year	—	-3.6%	2.5%	0.7%	-2.0%	-2.0%	-0.5%	Not available
<b>GHGRP</b>								
Number of direct-emitting facilities	7,645	7,896	7,982	8,205	8,043	7,672	7,572	7,655
Direct emissions (million metric tons CO <sub>2</sub> e)	3,318.4	3,169.3	3,189.5	3,203.5	3,056.1	2,989.8	2,921.9	2,987.3
Percent change in emissions from previous year	—	-4.5%	0.6%	0.4%	-4.6%	-2.2%	-2.3%	2.2%

<sup>a</sup> Inventory data from *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2017* (April 2019), Table ES-2.

**Table 6: Annual Emissions by Sector in MMT CO<sub>2</sub>e (2011–2018)**

Sector	2011	2012	2013	2014	2015	2016	2017	2018
Power Plants	2,221.7	2,089.5	2,105.7	2,101.7	1,972.5	1,876.7	1,799.4	1,814.6
Petroleum & Natural Gas Systems	222.3	225.7	228.0	235.3	235.7	278.8 <sup>a</sup>	285.1 <sup>a</sup>	315.9 <sup>a</sup>
Chemicals	180.4	173.0	174.6	177.2	177.6	177.4	184.4	191.3
<i>Fluorinated Chemicals</i>	17.3	14.4	13.4	11.7	10.3	7.5	9.9	8.1
<i>Non-fluorinated Chemicals</i>	163.1	158.6	161.2	165.4	167.3	169.9	174.5	183.2
Refineries	178.2	172.6	174.3	175.3	175.3	179.4	177.6	180.6
Minerals	103.2	107.8	111.5	117.0	115.0	110.7	114.3	116.4

Waste	114.9	115.0	111.3	111.9	110.4	107.7	105.7	108.9
Metals	112.0	106.8	106.9	104.5	90.9	87.1	89.5	94.1
Pulp & Paper	44.2	42.8	39.4	39.3	38.4	37.7	35.5	35.7
Other	141.6	136.0	137.8	141.5	140.4	134.2	130.3	130.0
<i>Underground Coal Mines</i>	40.9	38.8	41.0	41.2	43.9	39.2	37.3	35.0
<i>Electrical Equipment Production &amp; Use</i>	4.3	3.4	3.5	3.4	2.6	3.1	2.7	2.6
<i>Electronics Manufacturing</i>	7.0	6.4	5.2	6.2	6.3	6.2	6.1	6.3
<i>Miscellaneous Combustion</i>	89.5	87.4	88.1	90.6	87.5	85.7	84.2	86.1

<sup>a</sup> GHG data for the Petroleum and Natural Gas Systems source category is not directly comparable between 2011-2015 and 2016 onward. Facilities in the Onshore Oil & Gas gathering & Boosting and Onshore Gas Transmission Pipelines industry segments began reporting in 2016.

Figure 3: Trends in Direct GHG Emissions (2011–2018)<sup>a,b,c</sup>

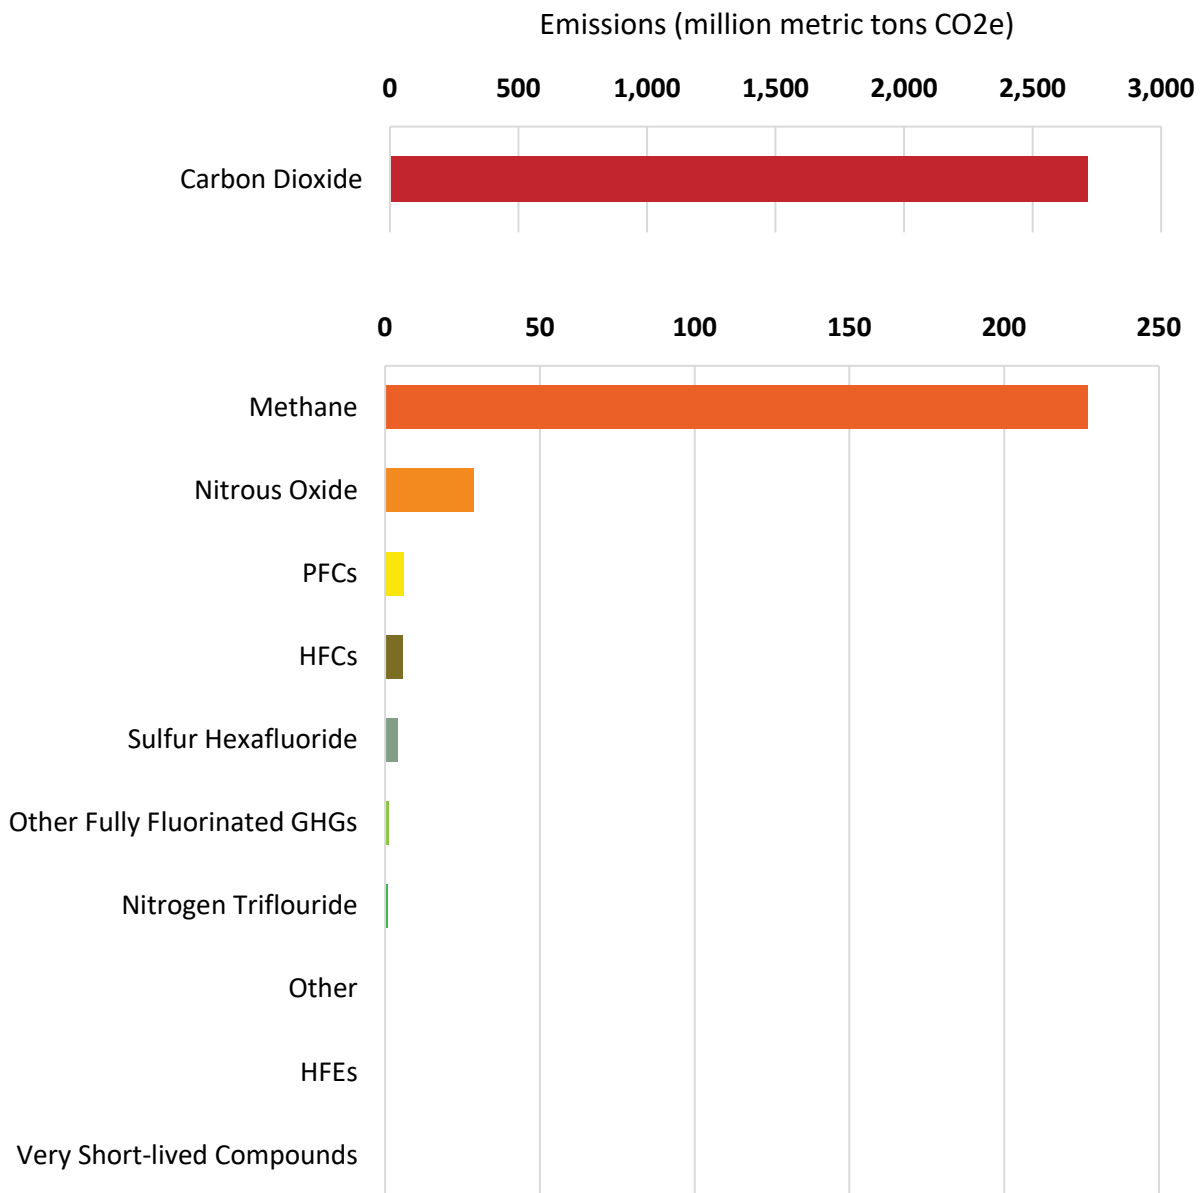

<sup>a</sup> Non-Fluorinated Chemicals and Fluorinated Chemicals are components of “Chemicals” in FLIGHT.  
<sup>b</sup> Miscellaneous Combustion, Underground Coal Mines, Electronics Manufacturing and Electrical Equipment Production & Use fall within the “Other” category in FLIGHT.  
<sup>c</sup> GHG data for the Petroleum and Natural Gas Systems source category is not directly comparable between 2011-2015 and 2016 onward. Facilities in the Onshore Oil & Gas gathering & Boosting and Onshore Gas Transmission Pipelines industry segments began reporting in 2016.

### Emissions by GHG

Carbon dioxide is the GHG emitted in the largest quantities. The 2.7 billion metric tons of CO<sub>2</sub> reported for 2018 represent 90.9% of the GHGs reported in 2018.<sup>1</sup> Methane emissions represent about 7.6% of reported 2018 GHG emissions, N<sub>2</sub>O represents 1.0%, and fluorinated gases (HFCs, PFCs, SF<sub>6</sub>) represent about 0.5% (see Figure 4).

**Figure 4: Direct Emissions by GHG (2018)**

<sup>1</sup> While the Inventory of U.S. Greenhouse Gas Emissions and Sinks for 2018 is not yet available, in 2017, CO<sub>2</sub> represented 82% of total U.S. GHG emissions.

The table below lists the primary sectors that emit each GHG.

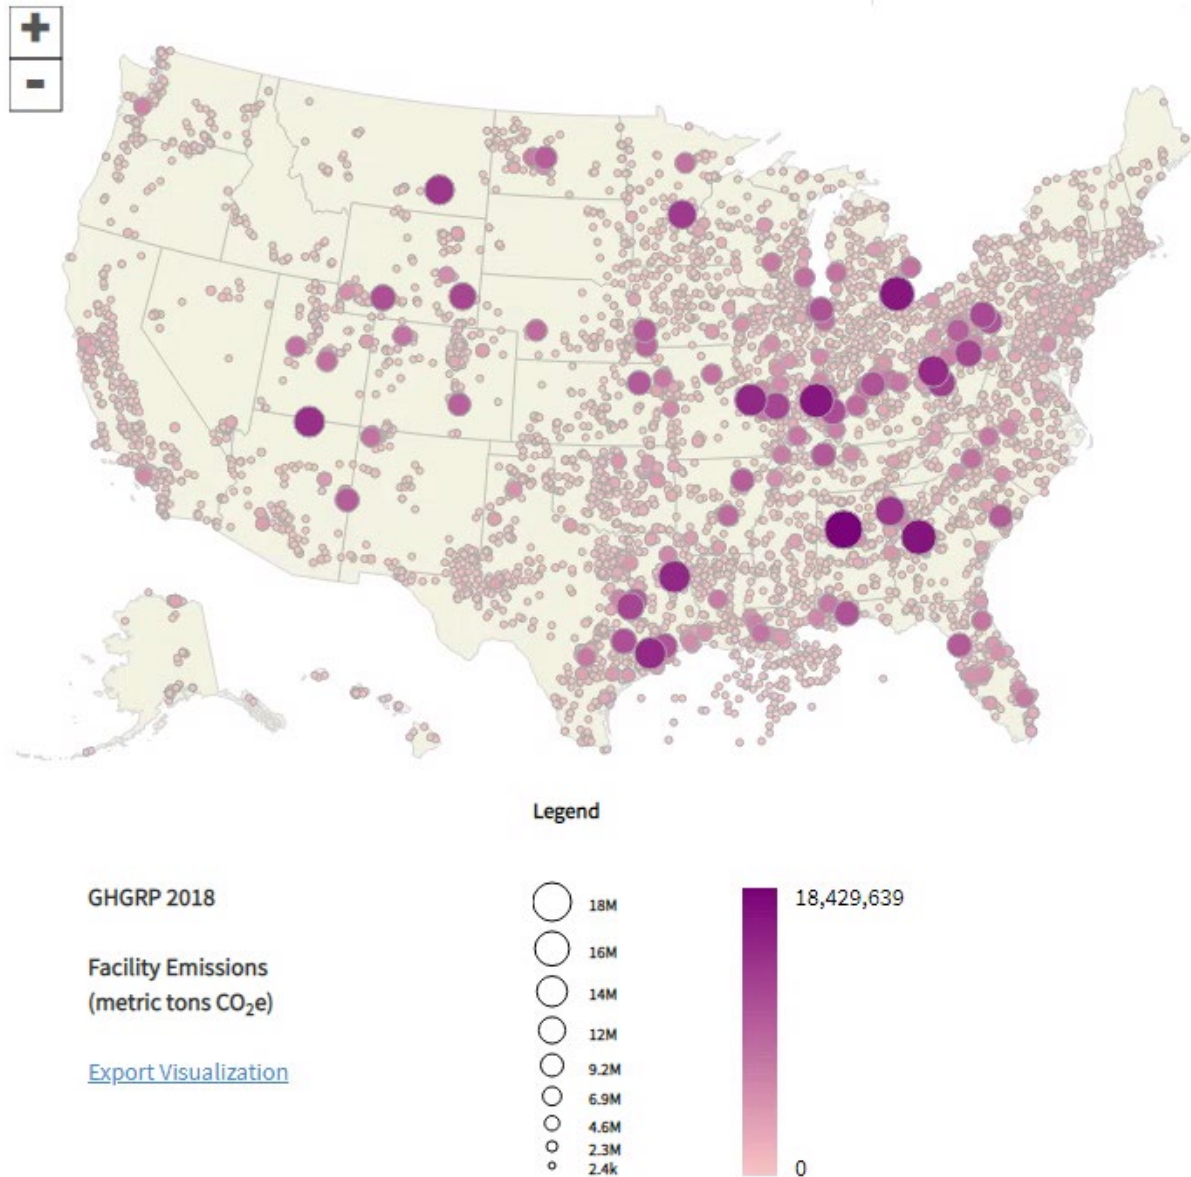

**Table 7: Largest Sources of GHG Emissions**

Greenhouse Gas	Source Categories Contributing Most to Emissions <sup>a</sup>	Sectors Contributing Most to Emissions
CO <sub>2</sub>	Electricity Generation (D), Stationary Combustion (C)	Power Plants, Petroleum and Natural Gas Systems
CH <sub>4</sub>	Petroleum & Natural Gas Systems (W), Municipal Landfills (HH)	Waste, Petroleum and Natural Gas Systems
N <sub>2</sub> O	Nitric Acid Production (V), Adipic Acid Production (E), Electricity Generation (D)	Chemicals, Power Plants
SF <sub>6</sub>	SF <sub>6</sub> from Electrical Equipment (DD), Electronics Manufacturing (I)	Other, Metals
NF <sub>3</sub>	Electronics Manufacturers (I), Fluorinated Gas Production (L)	Other, Chemicals
HFCs	HCFC-22 Production and HFC-23 Destruction (O), Fluorinated Gas Production (L)	Chemicals, Other
PFCs	Electronics Manufacturers (I), Fluorinated Gas Production (L)	Other, Metals, Chemicals

<sup>a</sup> These source categories account for 75% or more of the reported emissions of the corresponding GHG. The subpart which the emissions were reported under is shown in parentheses.

## Geographic Distribution of Emissions

Figure 5: Location and Total Reported Emissions from GHGRP Facilities (2018)

This map shows the locations of direct-emitting facilities. The size of a circle corresponds to the quantity of emissions reported by that facility. [There are also facilities located in Puerto Rico, the U.S. Virgin Islands, and Guam.](#)

Readers can identify facilities in their state, territory, county, or city by visiting [FLIGHT](#).

Because it generally applies to facilities that emit greater than 25,000 metric tons CO<sub>2</sub>e per year, the GHGRP provides total reported emissions from large stationary sources in each state. Figure 6 shows the reported emissions in each state broken out by industrial sector.

Figure 6: Direct GHG Emissions by State and Sector (2018)

### Emissions Range

The GHGRP provides a comprehensive dataset that can be used to determine the number of facilities at various emissions levels in many industry sectors. The GHGRP can also be used to determine the total GHG emissions from individual facilities, including emissions from fossil fuel combustion and other processes. This information is valuable for planning future policies. GHGRP data provide policy makers with a better understanding of the number of facilities and total emissions that would be covered by potential GHG reduction policies for various industries.

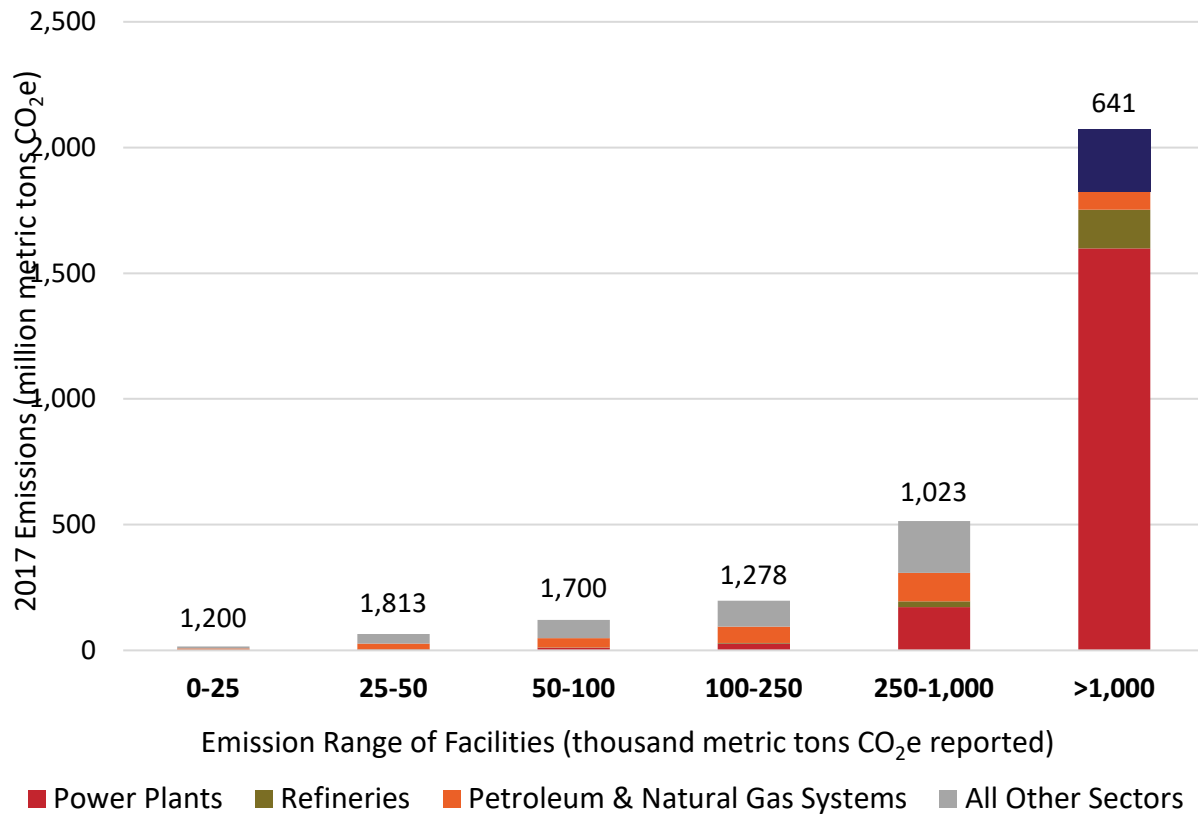

**Figure 7: Percentage of All Reporting Facilities at Various Emission Ranges<sup>a</sup> (2018)**

<sup>a</sup> Numbers at the top of the bars represent the number of reporters in that emissions range.

Seventy-nine percent of reporting facilities had emissions less than 250,000 metric tons CO<sub>2</sub>e. In 2018, the 641 largest-emitting facilities—those emitting more than one million metric tons CO<sub>2</sub>e—accounted for approximately 2.07 billion metric tons of CO<sub>2</sub>e. These emissions represent 69.4% of the total 2.99 billion metric tons of CO<sub>2</sub>e reported. These high-emitting facilities are mainly power plants, but they also include facilities in all other direct emitter sectors.

You can use [FLIGHT](#) to list and sort facilities based on total reported emissions and find the largest emitting facilities in the country or a specific state or county. This tool also allows you to sort facilities by specific industry types.

Figure 8: Facility Emission Ranges (2018)<sup>a</sup>

<sup>a</sup> Numbers at the top of the bars represent the number of reporters in that emissions range.

### GHG Calculation Methods Used

The GHGRP prescribes methodologies that must be used to determine GHG emissions from each source category. Reporters generally have the flexibility to choose among several methods to compute GHG emissions. The decision of which method to use may be influenced by the existing environmental monitoring systems in place and other factors. Reporters can change emission calculation methods from year to year and within the same year, as long as they meet the requirements for use of the method selected. [Access additional information on the methodologies that reporters use to determine GHG emissions.](#)

### Report Verification

All reports submitted to EPA are evaluated by electronic validation and verification checks. If potential errors are identified, EPA will notify the reporter, who can resolve the issue either by providing an acceptable response describing why the flagged issue is not an error or by correcting the flagged issue and resubmitting their annual GHG report. [Access additional information about EPA's verification process.](#)

### For More Information

For more detailed information from each industrial sector, view the [GHGRP Data Highlights website](#) and select an industry from the text box on the right hand side.

Use [FLIGHT](#) to view maps of facility locations, obtain summary data for individual facilities, create customized searchers, and display search results graphically.

Downloadable spreadsheets containing summary data reported to the GHGRP from each reporter are available on the [Data Downloads](#) page.

[All other publicly available data submitted to the GHGRP are available for download.](#)

The [U.S. Greenhouse Gas Inventory](#) contains information on all sources of GHG emissions and sinks in the United States from 1990 to 2017.

## GLOSSARY

**CO<sub>2</sub>e** means carbon dioxide equivalent, which is a metric used to compare the emissions from various greenhouse gases based upon their global warming potential (GWP). The carbon dioxide equivalent for a gas is calculated by multiplying the tons of the gas by the associated GWP.

**Direct emitters** are facilities that combust fuels or otherwise put greenhouse gases into the atmosphere directly from their facility. Alternatively, **Suppliers** are entities that supply certain fossil fuels or fluorinated gases into the economy that—when combusted, released or oxidized—emit greenhouse gases into the atmosphere.

**FLIGHT** refers to EPA's GHG data publication tool, named [Facility Level Information on GreenHouse Gases Tool](#).

**GHGRP** means EPA's Greenhouse Gas Reporting Program (40 CFR part 98).

**GHGRP vs. GHG Inventory:** EPA's Greenhouse Gas Reporting Program (GHGRP) collects and disseminates annual greenhouse gas data from individual facilities and suppliers across the U.S. economy. EPA also develops the annual Inventory of U.S. Greenhouse Gas Emissions and Sinks (GHG Inventory) to track total national emissions of greenhouse gases to meet U.S. government commitments to the United Nations Framework Convention on Climate Change. The GHGRP and Inventory datasets are complementary and may inform each other over time. However, there are also important differences in the data and approach. [Access more information.](#)

**GWP** means global warming potential, which is a measure of the total energy that a gas absorbs over a particular period of time (usually 100 years), compared to carbon dioxide. The GWP for carbon dioxide is one.

**IPCC AR4** refers to the Fourth Assessment Report by the Intergovernmental Panel on Climate Change. *Climate Change 2007: The Physical Science Basis. Contribution of Working Group I to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change [Core Writing Team, Pachauri, R.K. and Reisinger, A. (eds)]. IPCC, Geneva, Switzerland, 2007.* The AR4 values also can be found in the current version of Table A-1 in subpart A of 40 CFR part 98.

**IPCC AR5** refers to the Fifth Assessment Report by the Intergovernmental Panel on Climate Change. *Climate Change 2013: The Physical Science Basis. Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change [Stocker, T.F., D. Qin, G.-K. Plattner, M. Tignor, S.K. Allen, J. Boschung, A. Nauels, Y. Xia, V. Bex and P.M. Midgley (eds)]. Cambridge University Press, Cambridge, United Kingdom and New York, NY, USA.*
