Glossary of Terms

APPENDIX P

GLOSSARY OF TERMS

3-year rolling statistical metrics – Site- and pollutant-specific box plots illustrating five different parameters used to identify trends for a given site and pollutant; includes the minimum and maximum concentration measured during a given 3-year period; the 5th percentile, 50th percentile (or median), and 95th percentile over a given 3-year period; and the average concentration over a given 3-year period.

Accuracy – Indicates the extent to which experimental measurements represent their corresponding “true” or “actual” values. Also referred to as bias.

Acute risk – Risk associated with short-term exposures; acute health effects develop from a single exposure or from exposures over short periods of time (EPA, 2010b).

Air Quality System (AQS) – EPA's online repository of ambient air quality data.

Air Toxics – Pollutants that are known or suspected to have the potential for negative human health effects.

Analytical precision – A measurement of errors associated with the process of analyzing environmental samples.

Annual average – The average of all measured detections and substituted zeros for non-detects for a given calendar year. The calculation of annual averages includes the following criteria: 1) three valid quarterly averages must be available and 2) method completeness must be greater than or equal to 85 percent.

Anthropogenic sources – Sources of emissions that are man-made.

Audit samples – Samples that are prepared by an external source and analyzed by the laboratory, where the respective concentrations of the audit samples are unknown to the laboratory. The laboratory analyzes the samples and the external source compares the measured concentrations to the reference concentrations of those audit samples and calculates a percent difference.

Average Annual Daily Traffic (AADT) – The total volume of both directions of traffic on a highway segment for 1 year, divided by the number of days in the year (FL DOT, 2007).

Back Trajectory – A systematic way to trace the origin of an air parcel in relation to the location where it is currently being measured in time steps using meteorological parameters such as wind speed, wind direction, and atmospheric pressure.

Blank – A sample subjected to the usual analytical or measurement process to establish a zero baseline or background value. Blank samples are intended to contain none of the analytes of interest. Measurements from blanks are sometimes used to adjust or correct routine analytical results. A blank is used to detect contamination during sample handling, preparation and/or analysis.

Cancer risk – The likelihood of developing cancer as a result of exposure over a 70-year period, and is presented as the number of people at risk for cancer per million people.

Cancer risk approximation – An estimate of the cancer risk due to exposure at the annual average concentration over a 70-year period (and not the risk resulting from exposure over the time period covered in this report).

Central tendency statistics – Calculations to determine the central tendency, or value representing the “middle” of the data set, and includes the calculations of arithmetic mean (average), mode, and median.

Chain of custody – An unbroken trail of accountability that ensures the physical security of samples, data, and records.

Chronic risk – Risk associated with long-term exposures; chronic effects develop from repeated exposure over long periods of time (EPA, 2010b).

Cluster analysis – A grouping technique of the HYSPLIT model that allows the program to create a subset of trajectories or “clusters” that represent trajectories originating from similar locations.

Coefficient of determination – An indicator of how dependant one variable is on the other. If R^2 is equal to 1.0, the data exhibit perfect linearity; the lower R^2 , the less dependent the variables are each other.

Coefficient of variation – Provides a relative measure of variability by expressing standard deviation to the magnitude of the arithmetic mean.

Collocated samples – Samples collected simultaneously using two independent collection systems at the same location at the same time. See also *duplicate sample*.

Completeness – Refers to the number of valid samples collected and analyzed compared to the number of total samples expected based on a 1-in-6 or 1-in-12 day sample schedule.

Confidence interval – The interval within which the true average concentration falls 95 percent of the time. The confidence interval includes an equal amount of quantities above and below the concentration average.

Core Based Statistical Area (CBSA) – Refers to either a metropolitan or micropolitan statistical area (Census Bureau, 2012).

Data distribution statistics – Calculations that show how data are distributed in a given dataset and includes the first and third quartiles (25th and 75th percentiles and the median (50th percentile).

Data Quality Objectives (DQOs) – The qualitative and quantitative statements derived from the DQO Process that clarify a study’s technical and quality objectives, define the appropriate type of data, and specify tolerable levels of potential decision errors that will be used as the basis for establishing the quality and quantity of data needed to support decisions.

Data treatment – Techniques used to prepare a large quantity of data for data analysis.

Duplicate sample – A Sample collected simultaneously with a primary sample using the same sampling system (i.e., two separate samples through the same sampling system at the same time). See also *collocated sample*.

Estimate – A characteristic of the sample from which inferences on parameters can be made.

Failed screen – A pollutant concentration that is greater than its corresponding risk screening factor.

Field blank – A blank used to provide information about contaminants that may be introduced during sample collection, storage, and transport. A clean sample, carried to the sampling site, exposed to sampling conditions, returned to the laboratory, and treated as an environmental sample.

Global Warming Potential (GWP) – A value that expresses a pollutant’s ability to retain heat relative to carbon dioxide.

Greenhouse gases (GHGs) – Those gases that cause heat to be retained in the atmosphere.

Hazardous Air Pollutants (HAPs) – Those pollutants known or suspected to “cause cancer or other serious health effects, such as reproductive effects or birth defects, or adverse environmental and ecological effects” (EPA, 2011c).

Hydrocarbons – Organic compounds that contain only carbon and hydrogen.

Intermediate risk – Risk associated with an intermediate-duration exposures; exposures of 15 to 364 days (ATSDR, 2012).

Internal standard – A standard added to a test portion of a sample in a known amount and carried through the entire determination procedure as a reference for calibrating and controlling the precision and bias of the analytical method.

Mean (arithmetic), also called *average* – A measure of central tendency that is the sum of all the values of a set of measurements divided by the number of values in the set.

Measured detection – A quantifiable level or measurement of a given pollutant by a designated analytical instrument.

Method Detection Limit (MDL) – The lowest concentration at which laboratory equipment have been experimentally determined to reliably quantify concentrations of selected pollutants to a specific confidence level.

Method precision (also called sampling and analytical precision) – Quantifies random errors associated with collecting ambient air samples and analyzing the samples in the laboratory.

Metropolitan Statistical Area (MSA) – a geographic entity defined by the Office of Management and Budget containing a core urban area of 50,000 people or more (Census Bureau, 2012).

Micropolitan Statistical Area (MSA) – a geographic entity defined by the Office of Management and Budget containing a core urban area of at least 10,000 people but less than 50,000 people (Census Bureau, 2012).

Minimum Risk Level (MRL) – A concentration of a hazardous substance that is likely to be without appreciable risk of adverse noncancer health effects over a specified duration of exposure (ATSDR, 2012).

Mobile sources – Emitters of air pollutants that move, or can be moved, from place to place.

NATTS MQO Core analytes – A list of analytes that participating sites are required to sample and analyze for under the NATTS program.

Non-detect – A measurement that shows the pollutant was not detected at a quantifiable level by the instrument.

Noncancer risk – The risk associated with health effects other than cancer, such as asthma.

Noncancer risk approximation – An approximation, based on the annual average of the Noncancer Hazard Quotient (HQ), where an HQ greater than 1.0 indicates that adverse health effects are possible. If an HQ is equal to or less than 1.0, no adverse health effects are expected as a result of exposure (EPA, 2011b).

Nonpoint sources – Sources of emissions that individually are too small in magnitude or too numerous to inventory to include as individual point sources, and can often be estimated more accurately as a single aggregate source for a specific county or tribal area (EPA, 2012b).

Outlier – An extreme observation that is shown to have a low probability of belonging to a specified data population.

Pearson correlation coefficient – A number between -1 and +1 that indicates the degree of correlation between two variables or sets of numbers. The closer to -1 or +1, the stronger the linear relationship between the two (i.e., the better the correlation). Values close to zero suggest no correlation between the two variables.

Point sources – Sources of emissions that are individually inventoried and usually located at fixed, stationary locations. Point sources include large industrial facilities but also many smaller industrial and commercial facilities, which have traditionally been included in Nonpoint sources (EPA, 2012b).

Pollutants of interest – Those pollutants contributing to the top 95 percent of the total failed screens, either at the program-level or on a site-specific level, based on the risk screening process. In addition, the NATTS MQO Core Analytes are inherently considered pollutants of interest due to this designation within the NATTS program.

Pollution rose – A plot of the ambient concentration versus the wind speed and direction; high concentrations may be shown in relation to the direction of potential emissions sources.

Precision – A measure of mutual agreement between independent measurements performed according to identical protocols and procedures. (See also method precision and analytical precision.)

Preliminary risk screening process – A risk-based methodology for analysts and interested parties to identify (or screen) which pollutants may pose a risk in their area.

Preprocessed daily measurement – A single measurement for any given pollutant for a given method for a given sample day for a specific monitoring site. The preprocessed daily measurement can be an individual sample measurement or a measurement representing the average of the duplicate (or collocated) and replicate measurements.

Quality Assurance Project Plan (QAPP) – A formal document describing in comprehensive detail the necessary quality assurance, quality control, and other technical activities that must be implemented to ensure that the results of the work performed will satisfy the stated performance criteria.

Quarterly average – The average of concentrations measured within a given calendar quarter. The quarterly average includes the substitution of zeros for all non-detects. A site must have a minimum of 75 percent valid samples of the total number of samples possible within a given quarter for a quarterly average to be calculated.

Reference Concentration (RfC) – A screening value that is used to estimate noncancer risks and to identify (or screen) where air toxics concentrations may present a human health risk (EPA, 2011b).

Replicate samples – Repeated analyses performed on a duplicate or collocated pair of samples.

Risk – The probability that damage to life, health, or the environment will occur as a result of a given hazard (such as exposure to a toxic chemical) (EPA, 2011b).

Risk screening value – The risk factors upon which the preliminary risk screening process is based (see Preliminary risk screening process).

Scalar wind speed – The wind speed without accounting for wind direction, which together make up the wind vector.

Standard deviation – A measure of the dispersion or imprecision of a sample or population distribution expressed as the positive square root of the variance and has the same unit of measurement as the mean.

Standard Operating Procedure (SOP) – A written document that details the method for an operation, analysis, or action with thoroughly prescribed techniques and steps and that is officially approved as the method for performing certain routine or repetitive tasks.

Stationary sources – Sources of emissions that include both point and nonpoint sources. See also *point sources* and *nonpoint sources*.

Surrogate risk approximation – Cancer and noncancer risk approximations calculated to further the risk evaluation associated with a given pollutant of interest. See also *cancer risk approximation* and *noncancer risk approximation*.

Toxicity-weighted emissions – An EPA-approved approach that applies weight the quantity of emissions for a given pollutant based on toxicity, using the URE or RfC.

Unit Risk Estimate (URE) – A screening value that is used to estimate cancer risks and to identify (or screen) where air toxics concentrations may present a human health risk (EPA, 2011b).

Vehicle Miles Traveled (VMT) – The sum of distances traveled by all motor vehicles in a specified system of highways for a given period of time (OR DOT, 2012).

Wind rose – A graphic that illustrates the frequency of wind directions as petals positioned around a 16-point compass, and uses color or shading to represent wind speeds.
