GLOSSARY OF TERMS

1-Year average concentration – The average of all measured detections and substituted zeros for non-detects for a given calendar year. This average is used in the trends analysis section and differs from an annual average because the criterion for the quarterly averages is not required for its calculation.

Accuracy – Indicates the extent to which experimental measurements represent their corresponding “true” or “actual” values. Also referred to as bias.

Acute risk – Risk associated with short-term exposures; acute health effects develop from a single exposure or from exposures over short periods of time (EPA, 2010a).

Air Quality System (AQS) – EPA's online repository of ambient air quality data.

Air Toxics – Pollutants that are known or suspected to have the potential for negative human health effects.

Analytical precision – A measurement of errors associated with the process of analyzing environmental samples.

Annual average concentration – The average of all measured detections and substituted zeros for non-detects for a given calendar year. The calculation of annual averages includes the following criteria: 1) three valid quarterly averages must be available and 2) method completeness must be greater than or equal to 85 percent.

Anthropogenic sources – Sources of emissions that are man-made.

Audit samples – Samples that are prepared by an external source and analyzed by the laboratory, where the respective concentrations of the audit samples are unknown to the laboratory. The laboratory analyzes the samples and the external source compares the measured concentrations to the reference concentrations of those audit samples and calculates a percent difference.

Average Annual Daily Traffic (AADT) – The annual traffic count divided by the number of days in the year, and incorporates both directions of traffic (FHWA, 2013a).

Blank – A sample subjected to the usual analytical or measurement process to establish a zero baseline or background value. Blank samples are intended to contain none of the analytes of interest. Measurements from blanks are sometimes used to adjust or correct routine analytical results. A blank is used to detect contamination during sample handling, preparation and/or analysis.

Cancer risk – The likelihood of developing cancer as a result of exposure over a 70-year period, and is presented as the number of people at risk for cancer per million people.

Cancer risk approximation – An estimate of the cancer risk due to exposure at the annual average concentration over a 70-year period (and not the risk resulting from exposure over the time period covered in this report).

Central tendency statistics – Calculations to determine the central tendency, or value representing the “middle” of the data set, and includes the calculations of arithmetic mean (average) and median.

Chain of custody – An unbroken trail of accountability that ensures the physical security of samples, data, and records.

Chronic risk – Risk associated with long-term exposures; chronic effects develop from repeated exposure over long periods of time (EPA, 2010a).

Coefficient of variation – Provides a relative measure of variability by expressing standard deviation to the magnitude of the arithmetic mean.

Collocated samples – Samples collected simultaneously through separate inlet probes, regardless of sampler set-up (i.e., either two separate sampling systems or a single sampling system with multiple inlets). See also *duplicate sample*.

Data distribution statistics – Calculations that show how data are distributed in a given dataset and includes the first and third quartiles (25th and 75th percentiles) and the median (50th percentile).

Data Quality Objectives (DQOs) – The qualitative and quantitative statements derived from the DQO Process that clarify a study’s technical and quality objectives, define the appropriate type of data, and specify tolerable levels of potential decision errors that will be used as the basis for establishing the quality and quantity of data needed to support decisions.

Data treatment – Techniques used to prepare a large quantity of data for data analysis.

Duplicate sample – A sample collected simultaneously with a primary sample through a common inlet probe such that the same air parcel is being sampled. This simultaneous collection is typically achieved by teeing the line from the sampler to two canisters (or other sampling media) and doubling the flow rate applied to achieve integration over the 24-hour collection period. See also *collocated sample*.

Estimate – A characteristic of the sample from which inferences on parameters can be made.

Failed screen – A pollutant concentration that is greater than its corresponding risk screening value.

Field blank – A blank used to provide information about contaminants that may be introduced during sample collection, storage, and transport. A clean sample, carried to the sampling site, exposed to sampling conditions, returned to the laboratory, and treated as an environmental sample.

Global Warming Potential (GWP) – A value that expresses a pollutant’s ability to retain heat relative to carbon dioxide (EPA, 2015c).

Greenhouse gases (GHGs) – Those gases that cause heat to be retained in the atmosphere.

Hazardous Air Pollutants (HAPs) – Those pollutants known or suspected to “cause cancer or other serious health effects, such as reproductive effects or birth defects, or adverse environmental and ecological effects” (EPA, 2014d).

Hydrocarbons – Organic compounds that contain only carbon and hydrogen.

Internal standard – A standard added to a test portion of a sample in a known amount and carried through the entire determination procedure as a reference for calibrating and controlling the precision and bias of the analytical method.

Mean (arithmetic), also called *average* – A measure of central tendency that is the sum of all the values of a set of measurements divided by the number of values in the set.

Measured detection – A quantifiable level or measurement of a given pollutant by a designated analytical instrument.

Method Detection Limit (MDL) – The lowest concentration at which laboratory equipment have been experimentally determined to reliably quantify concentrations of selected pollutants to a specific confidence level.

Method precision (also called *sampling and analytical precision*) – A measurement of errors associated with collecting ambient air samples and analyzing the samples in the laboratory.

Measurement Quality Objective (MQO) – Objectives designed to evaluate and control the various phases of the measurement process (sampling, preparation, analysis) to ensure that the measurements meet the overall program objective(s).

Metropolitan Statistical Area (MSA) – A geographic entity defined by the Office of Management and Budget containing a core urban area of 50,000 people or more (Census Bureau, 2013b).

Micropolitan Statistical Area – A geographic entity defined by the Office of Management and Budget containing a core urban area of at least 10,000 people but less than 50,000 people (Census Bureau, 2013b).

NATTS MQO Core analytes – A list of analytes that participating sites are required to sample and analyze for under the NATTS program (EPA, 2009b).

Non-detect – A measurement that indicates the pollutant was not detected at a quantifiable level by the instrument.

Noncancer risk – The risk associated with health effects other than cancer, such as asthma.

Noncancer hazard approximation – An approximation, based on the annual average, of the Noncancer Hazard Quotient (HQ), where an HQ greater than 1.0 indicates that adverse health effects are possible. If an HQ is equal to or less than 1.0, no adverse noncancer health effects are expected as a result of exposure (EPA, 2011b).

Nonpoint sources – Sources of emissions that individually are too small in magnitude or too numerous to inventory to include as individual point sources, and can often be estimated more accurately as a single aggregate source for a specific county or tribal area (EPA, 2015a).

Outlier – An extreme observation that is shown to have a low probability of belonging to a specified data population.

Pearson correlation coefficient – A number between -1 and +1 that indicates the degree of correlation between two variables or sets of numbers. The closer to -1 or +1, the stronger the linear relationship between the two (i.e., the better the correlation). Values close to zero suggest no correlation between the two variables.

Point sources – Sources of emissions that are individually inventoried and usually located at fixed, stationary locations. Point sources include large industrial facilities but also many smaller industrial and commercial facilities, which have traditionally been included in Nonpoint sources (EPA, 2015a).

Pollutants of interest – Those pollutants contributing to the top 95 percent of the total failed screens, either at the program-level or on a site-specific level, based on the risk-based screening process.

Quarterly average – The average of concentrations measured within a given calendar quarter. The quarterly average includes the substitution of zeros for all non-detects. A site must have a minimum of 75 percent valid samples compared to the total number of samples possible within a given calendar quarter for a quarterly average to be calculated.

Reference Concentration (RfC) – An estimate of continuous inhalation exposure to the human population that is likely to be without an appreciable risk of deleterious noncancer health effects over a lifetime and is used to identify (or screen) where air toxics concentrations may present a human health risk (EPA, 2011b).

Replicate samples – Repeated analyses performed on a duplicate or collocated pair of samples. Replicate analysis was also performed on select individual samples.
