1.0 Executive Summary

This investigation was performed to identify Potential Remediation Partners (PRPs) that may be recruited to participate in activities associated with remediating contaminated sediments. Contaminated sediments in the Detroit River have been identified as a significant contributor to beneficial use impairments (BUIs). The target of the investigation was to identify non-Federal entities that may have engaged in activities that could have contributed to the contaminated sediments or that may have a direct interest in particular areas of the Detroit River. The objective of the investigation is to identify PRPs that may have interest in participating in a Great Lakes Legacy Act project.

The Riverbend Site extends from the center of Detroit (at the Cobo Center) downstream (southwest) to the mouth of the Rouge River (Old Channel). The area between roughly what is now West Fort Street (M-85) and the river front was the site of intensive industrial activity from the early 1800s until the mid-1900s. Before this time period, Detroit was a garrison town, fur trading center and farming community. After the mid-1900s, industry activity rapidly declined and most either left the area or discontinued operations. The focus of inquiry was the industrial period to identify entities that may have discharged contaminants of the type and at quantities that could exist in sediments today. Industry located along the Detroit River commonly discharged untreated process waste water directly into the river for most of this period and combined sewer overflows may continue to contribute contaminants occasionally.

The eight (8) entities that have been identified as likely significant contributors of the types of contaminants found in Riverbend Site sediments should be contacted as priority Potential Remediation Partners. The Great Lakes Works (**US Steel**), Detroit Edison Delray Power Plant (**DTE**), Detroit City Gas Company (**DTE**), Mistersky Power Plant (**DTE**), Solvay Processes (**Honeywell**), Letts Drop Forge (**Letts Industries**), Fisher Body Plant (**GM**), and Timken Detroit Axle Plant (**Meritor**) are all existing and viable successor organizations to the industrial activities currently or formerly operating in the Riverbend Area.

It is also recommended that **DuPont** be solicited for participation in remediation actions based on their direct involvement in processing activities at Revere Copper & Brass Company facility. During and following World War II (1943 thru 1954) the Revere plant in Detroit processed uranium rods for atom bomb production following processing and handling direction from DuPont. Further, it would appear prudent to perform some limited sediment investigations downstream of the Revere plant to ascertain the presence or absence of radioactive wastes (perhaps previously collected core samples have been retained and can be evaluated with a radmeter).

2.0 Introduction

The Great Lakes are one of the most important natural resources in North America. Contamination from urban development, agricultural run-off, and industrial activity over the years has adversely affected water quality. Several areas within the Great Lakes where resources have limited beneficial uses have been designated as Areas of Concern (AOCs).

Congress authorized the Great Lakes Restoration Initiative (GLRI) to leverage clean-up of Great Lakes AOCs and restore beneficial uses. Under GLRI is the Great Lakes Legacy Act (GLLA), a program to address contaminated sediments in Great Lakes AOCs.

To date, 20 GLLA projects have been completed throughout the Great Lakes. Over 4 million cubic yards of sediment at twenty sites have been cleaned-up providing significant water quality improvement around the Great Lakes. The program has leveraged over \$266M from States, Industries, and Natural Resource Damage Assessments.

Congress created GLLA as a cost-share program. All GLLA projects must involve the participation of non-federal sponsor(s) or partner(s) contributing a minimum 35% of the overall response action. Participation can be through contributions of cash or like kind service.

US EPA has worked with over 37 industries and a variety of other non-Federal partners so far on GLLA projects throughout the Great Lakes.

The Detroit River is a Great Lakes AOC. A key concern driving impairments to beneficial use of the Detroit River is contaminated sediments.

The Michigan Department of Environment, Great Lakes, and Energy (EGLE) in cooperation with US EPA Great Lakes National Program Office (GLNPO), and Detroit River Public Advisory Committee (PAC), initiated an effort to define “known contaminated sediment sites” in the Detroit River. From 2013-2016, USEPA GLNPO completed five contaminated sediment site characterizations within the Detroit River (Figure 1) in areas identified by the PAC. The effort resulted in the delineation of six “sediment target sites”. The target sites are identified as: Harbortown; Riverbend; River Rouge/Ecorse Shoreline; McLouth/Grosse Ile Shoreline; Elizabeth Park Canal; and, Gibraltar Canals.

This report addresses the Riverbend Target Area (Figure 2) and is intended to identify entities that have or had a presence in the area and may have contributed sediments in the Detroit River. Many have benefited over the years from use of the natural resource provided by the Detroit River. These entities may be potential partners in addressing sediment issues in the Detroit River. Participation is strictly voluntary. Additional information on the GLLA can be found on the EPA website at

<https://www.epa.gov/great-lakes-legacy-act/about-great-lakes-legacy-act>

3.0 Methodology

This investigation is performed to identify Potential Remediation Partners (PRPs) that may be recruited to participate in activities associated with remediating contaminated sediments. Contaminated sediments in the Detroit River have been identified as a significant contributor to impairments to beneficial uses (BUIs). The target of the investigation is to identify non-Federal entities that may have engaged in activities that could have contributed to the contaminated sediments or that may have a direct interest in particular areas of the Detroit River. The objective of the investigation is to identify PRPs that may have interest in participating in a Great Lakes Legacy Act project.

This investigation is conducted by reviewing existing data and information identified through available sources. References are included in Section 8 of this report. No new data is created through site investigations, sampling or analytical work by this effort. Digital records are the primary source of data and information, supplemented with printed material that may be identified during the course of the investigation. Professional judgment is used to evaluate the relevance of data and information in identifying PRPs. The review methodology involves a process to identify and collect information that generally progresses as follows;

- The target area of sediment contamination is identified within the AOC. Information is obtained describing the general volume and character of the sediment contamination. This information is made available by USEPA, State partners, and other team members that may be involved at the initial stage of the investigation. Other relevant information and/or anecdotal observations that might suggest avenues of further inquiry are often provided at initiation of the investigation. Sediment characterization reports are valuable in identifying specific contaminants and the types of activities that may have generated them.
- Web-based open-source mapping (e.g. Google Maps, Yahoo Maps, MapQuest, Bing Maps, National Geographic Maps) of the target area is reviewed with both street map and satellite imagery. These maps are useful in identifying current land use and entities adjacent to the target area.
- A preliminary web search is performed for entities identified during the investigation initiation and open-source map searches. Web sites often exist that contain information on the nature of activities performed by the entity at the site, history of the entity and site activities, key operating personnel, contact information, financial status, community and environmental principles, prior site owners, and more. This information may be useful in evaluating the entity's potential contribution of contaminants to sediments and viability as a PRP.
- A search area is designated adjacent to the target sediment area that is reasonably likely to have (or had) entities that could have contributed contaminants. An electronic data searching service (i.e. EDR) is engaged to locate and provide information on all entities within the designated search area with an environmental record or 'foot-print'. Virtually all publicly searchable data bases maintained by Federal, State, Tribal and Local

environmental jurisdictions are searched to identify entities that have a record of air, water, waste, and/or environmental management activities within the designated search area. See Figure 3 EDR Corridor Report (presented at the back of this report because of its size) for search results related to the Riverbend Area and a complete listing of government data bases searched (Page GR-1). Further, EDR maintains several proprietary data bases with environmental information to supplement the public data base searches. These records are useful in identifying entities, the nature of their activities and sometimes contact information. It is often the case that hundreds or even thousands of records are identified. In this particular case, 1,267 pages of environmental records were identified. Professional judgment is used to screen out those entities that have minimal potential as candidate PRPs. Follow-on web searches for the remaining identified entities are often performed to obtain additional information to support evaluations of the candidate PRPs.

- In addition to data files, historical imagery is used to supplement information on the search area. Historical aerial photos, topographic maps and Sanborn Fire Insurance Maps are provided in digital format often from the early 1900's to present. See Figure 4 for aerial photographs (presented at the back of this report because of its size) of the search area from 1937 through 2016 (42 photos). Results of the Sanborn Map search may be found in Figure 5 (presented at the back of this report because of its size). These images can be useful in evaluating land use over time and may indicate entities not captured in the data records.
- Professional judgment is used to evaluate all identified entities. Evaluation criteria include 1) does the nature of the entities activities suggest they could have contributed contaminants to the sediments, 2) Is it possible that activities could have generated volumes of contaminants for a duration that could represent a significant contribution to the existing sediments, 3) Does the entity (or successor entity) exist now, and 4) Does the entity appear to possess the resources (financial or other) needed to contribute to remediation activities. The evaluation criteria are informed by further web searches of entity sponsored sites, news articles, library sites, trade association sites, and others.
- A final evaluation is performed to assess a candidate PRP's likelihood to participate. This is largely based on professional judgment and informed by the entity's environmental track record, stated environmental and community commitments, apparent availability of necessary resources, and potential for independent response liability.

4.0 History of each site ^{a/ b/ c/ d/ e/ f/ g/ h/ j/}

This project involved evaluation of six targeted areas located along the Detroit River Area of Concern (AOC) identified for possible contaminated sediment remediation. The Riverbend Site is one of these areas and is downstream of the Harbortown Site and upstream from the River Rouge-Ecorse Site. The Riverbend Site extends from the center of Detroit (at the Cobo Center) downstream (southwest) to the mouth of the Rouge River (Old Channel). The area between roughly what is now West Fort Street (M-85) and the river front was the site of intensive industrial activity from the early 1800s until the mid-1900s. Before this time period, Detroit was a garrison town, fur trading center and farming community. After the mid-1900s, industry activity rapidly declined and most either left the area or discontinued operations. The focus of inquiry was the industrial period to identify entities that may have discharged contaminants of the type and at quantities that could exist in sediments today. Industry located along the Detroit River commonly discharged untreated process waste water directly into the river for most of this period and combined sewer overflows may continue to contribute contaminants occasionally.

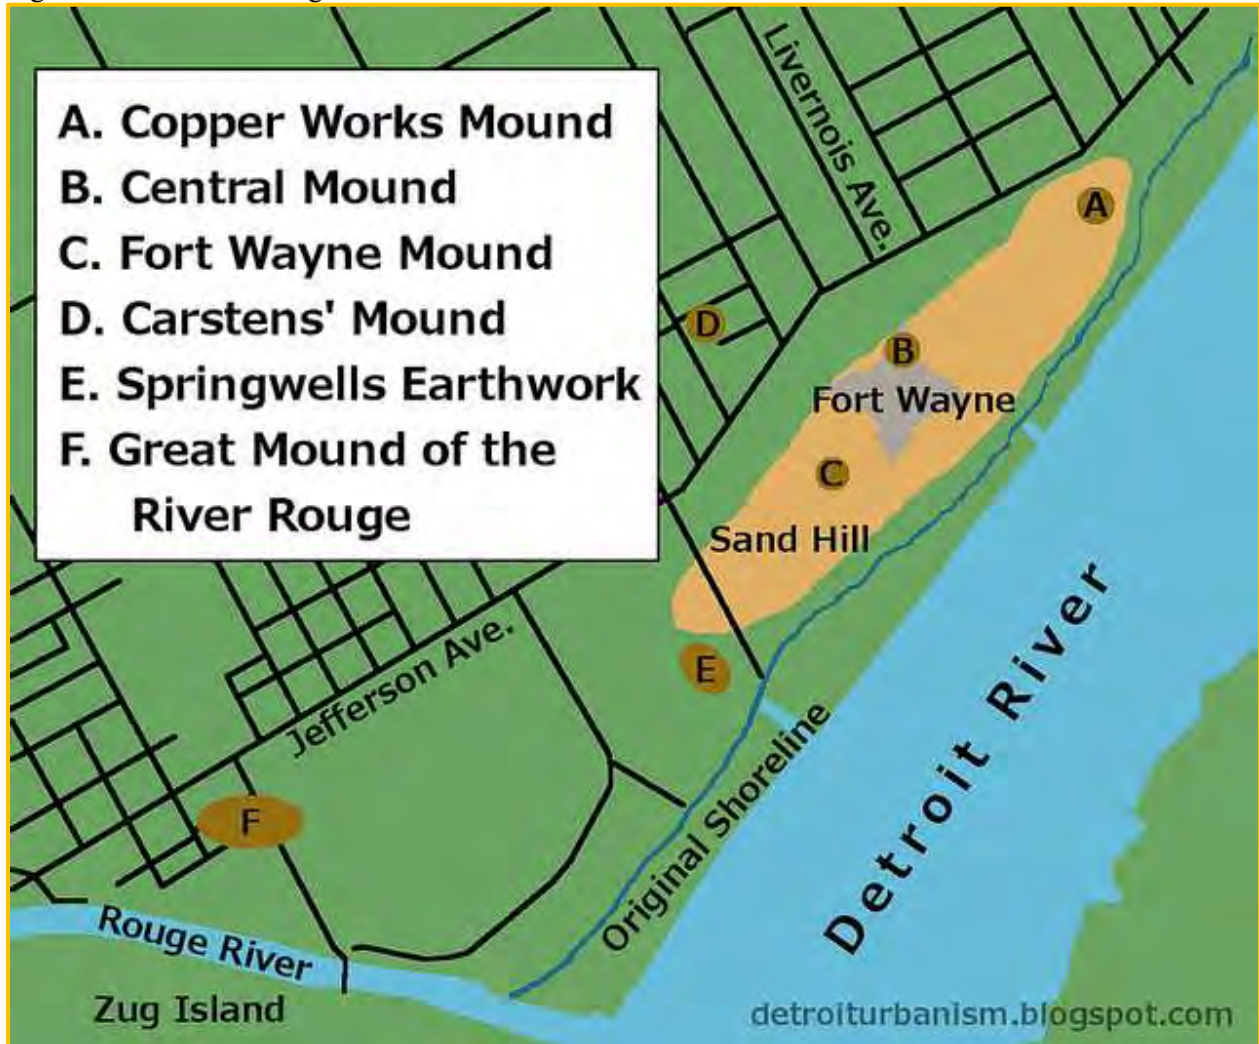

The history of industrial development in the Riverbend Area largely mirrors that of the Harbortown Area. However, the enterprises tend to be larger as industry spread west of the city center and moved downstream. Close in to the city center the enterprises were small in area and packed in close to the river (as was the case in the Harbortown Area). Many of these ‘smaller’ enterprises were the machine shop, tool making, parts fabricating, foundry, engine, and ship building, carriage, and automobile support activities (as was the case in the Harbortown Area). Several of the ‘larger’ enterprises that developed further downstream were related to primary materials processing and included copper smelting, steel, and chemical manufacturing. There were also brick and cement manufacturers. Industrial development and activity in the area peaked in the early to mid-1900s and rapidly dropped off after World War II. Today, steel manufacturing is the only remaining industry in the Riverbend Area that may have discharged waste water that would significantly contribute to contaminated sediments (except incidental, episodic CSO discharges).

However, it is likely that discharges from the past, even distant past, may have contributed significantly to sediments in the river that exist today. Most common predictive flow models have failed to adequately describe contaminant transport in the Detroit River. Inquiries have revealed that typical Detroit River sediments result from larger, heavier particles than most flow models tend to predict. Consequently, discharges of larger, heavier particles along the Detroit River fall out of the water column quicker and would deposit along the bank out of the fast flowing mid-river channel. These sediments would remain until or unless disturbed by dredging.

The location of Detroit as a settlement was selected because of the strategic position controlling water travel between the upper and lower Great Lakes. Of significant importance during this early period of development were sandy beaches for easy canoe landing. These sandy beaches were predominantly in the Riverbend Area. Marshy wetlands were upstream (Harbortown Area) and downstream (Rouge River delta). This important attribute contributed significantly to the initial establishment of a military fort to control the straits of Detroit (Fort Wayne) that existed throughout the history of the city and remains present today. The various Native American tribes also availed themselves of the canoe landing site and occupied the area as an important meeting

and burial site for millennium before the arrival of Europeans. The sandy soil allowed Native Americans to raise many burial mounds that preceded and were ultimately decimated by the industrial development. See Figure 3 for an illustration noting the approximate location of many of the Native American burial mounds once located in the Riverbend Area.

Figure 3 Illustration noting several Native American burial mounds

The strategic position played an important role in industrial development. Access to natural resources (iron, copper and timber from the north and coal from the east) via water sparked industrial development. Transportation by water of finished products to markets in the east and west and overseas was also possible during early industrial development before being enhanced and sustained by follow-on railways and roadways.

As industrial development in the city ‘ramped-up’, it was the relatively undesirable (and cheap) swamp land east of the city along the river front that was first developed (what we are calling the Harbortown Site) and quickly spread west downstream (what we are calling the Riverbend Site). Development in the Riverbend Area often followed-up on earlier activities in the Harbortown

Area. The Detroit Dry Dock Company expanded on their Harbortown facility by relocating to a roomier location downstream in the Riverbend Area. Similarly, a second coal gasification plant was built (following the initial facility in the Harbortown Area) further downstream in the Riverbend Area. A similar mix of industry to that in the Harbortown Area also spread to the Riverbend Area including lumber mills (a paper mill operated for many years on the lower Rouge River), tanneries, foundries, machine shops, carriage manufacturers, warehouses, ice houses, bars, butcher shops, stables, tobacco, stove, and automobile factories. Most of these entities have gone out of business with no identifiable successors. It is the larger industrial enterprises that had the most significant potential of discharging the quantities of contaminants with the characteristics observed in river sediments that are of primary interest here.

There is only entity that emerged from the history of industrial activity that had the potential of contributing significantly to river sediments continuing to operate today; US Steel on Zug Island. There are an additional nine (9) entities that have been identified as potential significant contributors to river sediments that no longer exist as activities in the Riverbend Site, but viable successor organizations have been established (These include Delray Power Plant, Detroit City Gas Co., Mistersky Power Plant, Revere Copper & Brass, Solvay Process, Kelsey Hayes, Letts, Fischer Body Plant, and Timken Axle Plant). Further, many other enterprises have been identified that operated in the Riverbend Area with the potential to contribute contaminants of the type identified in Detroit River sediments, but they no longer exist and no successor activities could be identified (These include Anaconda Brass, Peninsular Stove, Detroit & Superior Copper Smelting, Detroit Lead, Detroit Harvester, Michigan Malleable Iron, and Freuhauf). This is not an exhaustive compilation of all industrial activities that existed in the Riverbend Area (there are certainly many more), but rather a representative sampling of the type of entities that have operated over time. In addition, the EDR Corridor Search digital source review yielded 1,267 pages of data regarding entities with an environmental record (306 individual records). Importantly, the sheer number of industrial and commercial entities that have or had the potential of discharging contaminants to the Detroit River is noteworthy (if not necessarily useful in identifying potential remediation partners).

Great Lakes saw mills typically shipped lumber not used for local construction to east coast cities or Chicago. Not Detroit saw mills. The Detroit saw mills fed the emerging carriage/wagon and ship building industries. During the 1830s to 1850s Michigan saw a large influx of immigrants (mostly from New York and New England) arriving by ship and passing through Detroit on their way inland. The new immigrants had need of wagons to move inland and ships were needed to exploit Great Lakes commerce (iron ore, copper, timber, coal, and passenger). Detroit lumber was used to supply the emerging manufacturing. Among the ship building enterprises was Detroit Dry Dock Company (est. 1852) at the foot of Orleans Street and later expanded downstream to another location with more room in the Riverbend Area (the enterprise is now gone with no viable successor entities identified). Small carriage shops were spread throughout the city.

The need for metal fixtures and components for carriage and ship building became immediately apparent. Iron ore and copper from the Upper Peninsula and coal from the east (Pennsylvania) converged on Detroit. Iron/steel refining and copper smelting facilities were constructed and fed small foundries and metal working enterprises throughout the area. The Detroit & Lake Superior Copper Company (now gone, no successors) established a copper smelter on the Detroit River next to Fort Wayne and Great Lakes Steel Company established steel making facilities on Zug

Island. Iron and steel was cast and forged, machined and hardened and copper was cast and combined with tin, zinc, and lead to make bronze and brass for fixtures. There was even some aluminum being cast.

By the mid-1800s sailing ships were being replaced by steam ships and wood hulls were being replaced by metal. The early metal shops transitioned and new enterprises were established to include manufacturing of ship boilers, engines and pumps. Many of these factories were located in the Harbortown and Riverbend Areas. Most of the saw mills disappeared. But a paper mill was created in their wake on the lower reaches of the Rouge River just before it's confluence to the Detroit River (Lower Rouge River – Old Channel, 2011, GLNPO). Detroit became a major exporter of marine engines and ships (over half of all Great Lakes ships were manufactured in Detroit as well as many ocean going vessels).

Tooling to work metal came into demand and many tool manufacturers were established next to and among the metal working enterprises in the Riverbend Area. Tool making remained a significant presence in the Riverbend area well into the mid-1900s. Advancements in tool making equipment following World War II dramatically reduced the number of tool making enterprises needed and most of these establishments went out of business (although demand for new tools actually increased). A couple of these tool making enterprises have been included in this report to represent the group (Greenfield and United), but as a group they do not represent viable potential remediation partners. The availability of metals, coal and skilled tradesmen spurred development of other industries, most notably stoves and railcars.

Freestanding cast iron stoves were a major technological breakthrough for home heating and cooking in the mid-1800s. Originally manufactured primarily in New York each weighing hundreds of pounds, shipping to emerging markets in the mid-west made Detroit an ideal location to become a center for stove manufacturing. The Peninsular Stove Company was operated between West Fort Street and Jefferson Avenue and 8th and 10th Streets from 1881 until 1920 when it was moved further west to the outskirts of the city. The US Post Office now occupies the site. Peninsular Stove Company closed in 1931 (after 40-years of operation) with no successor entities identified.

About the same time that stove manufacturing was taking off, demand for railcars was being addressed by Detroit manufacturers. The established base of foundries and skill tradesmen made Detroit a natural location for manufacturing wheels and undercarriages as well as the many carriage fitting and appurtenances. Combined with the many existing wagon/carriage builders (that transitioned to building boxcars and passenger cars) quickly established Detroit as the center of railcar production in the United States. The Riverbend Area was not the center of this activity, but several supporting factories were located in the area including the Buhl Iron Works that made railcars and locomotives and the Michigan-Penninsular Car Company facility just a couple miles inland from the Detroit River.

The growing population and industries of Detroit from the mid-1800s through the mid-1900s drove a demand for public services. First was the need for potable water. A river water intake and storage tower was constructed at the foot of Orleans Street in the late 1830s to supply drinking water to the city. The resulting indoor plumbing (sinks and toilets) increased consumption of water from 10-15 gallons to over 100 gallons per capita per day. Sewers were

quickly constructed to convey waste water directly to the river (or the nearest stream, e.g. Conners Creek). Sewer discharges upstream of the Orleans Street river intake contributed to disease outbreaks in 1832 and 1834 that eventually killed 1/8 of the city's population. In response, a plan was devised to relocate the potable water intake north of Belle Isle (1860), divert sewers to Conners Creek (downstream of the new intake) or the Detroit River, and combine storm water and sanitary sewers. No sewerage treatment was provided. This remained the sewer plan for the next 70-80 years. New and expanded sewers in the Riverbend Area went direct to the river, untreated. In the 1920s, plans were developed to collect city sewers and discharge at a common point to allow for some level of treatment (primarily chlorination for disease control. By 1937 the Detroit River Interceptor (that runs along Jefferson Avenue and collects sewers in both the Riverbend and Harbortown Areas) was completed, although many of the sewer connections to the interceptor were not opened until the early 1940s. The Detroit River Interceptor (and other interceptors) convey city sewers to a point by the Rouge River for, initially, rudimentary primary treatment and chlorination prior to discharge to the Detroit River. Importantly, until this occurred, all industrial waste water (Riverbend Area and elsewhere) went directly (untreated) to the Detroit River with discharges at the shoreline.

The other notable public service was lighting. Prior to electricity, gas burning fixtures were used for both public and indoor lighting. The gas was distributed by pipes buried along streets and derived from coal. The process of gasifying coal created several by-products including coke, tars, creosol, and distillates. The first coal gasification plant in Detroit was established in the Harbortown Area. A second coal gasification plant in the city was located at the base of what is now the Ambassador Bridge in the Riverbend Area to meet growing demand. When electricity became a viable alternative, coal fired electricity generating plants were constructed around the city including one operated by the City of Detroit (Mistersky) located at West Jefferson Avenue and Junction Street to the foot of the river to supply electricity for public lighting.

There were other significant enterprises located in the Riverbend Area or just inland through the years. Most notable was the solvay processing factories located at the confluence of the Rouge and Detroit Rivers. The solvay process produced caustic soda (used in glass manufacturing) from salt (pumped from brine wells on-site) and ammonia (produced as a by-product of coke manufacturing on-site). Two major brass and copper casting, forging, and manufacturing plants were located along the river in the Riverbend Area (Anaconda and Revere). The automobile industry was well represented in the Riverbend Area as well. GM operated major body fabrication plants in Delray (Fisher Body Fleetwood Plant), Cadillac Body Plant on 23rd Street, and a couple miles in-land was the Clark Cadillac Assembly Plant, they are now gone and GM went through Chapter 11 bankruptcy leaving legacy liability behind. Still other major automobile suppliers were present in the Riverbend Area including Kelsey-Hayes Wheel, Timken Detroit Axle, and Detroit Harvester.

Just in-land from the Riverbend Area was other noteworthy activities. Several brick yards were located a couple miles in-land from the Detroit River using local clay to manufacture bricks used throughout the region (Detroit Red) and the Detroit Salt Mine is located just outside the Downtown area in-land from the river.

Most, if not all of these entities discharged untreated process waste water directly into the Detroit River. Many of the processes used would involve discharges including oils, greases, and metals.

Some could be significant in terms of volume discharged, but for relatively short duration. Others may have resulted in relatively minor discharges over a longer duration. See Historic Map 1 for the locations of many of these outfalls. The following describes many of the sources that operated in the Riverbend Site throughout the years of industrial activity and provides an assessment of their potential as sediment remediation partners. See Figure 4 for the locations of identified potential remediation partners.

Anaconda American Brass Company (Detroit Copper & Brass Rolling Mills Company)

Figure 5 – Detroit Copper & Brass Rolling Mill, circa 1910

Detroit Copper & Brass facility, later to become Anaconda American Brass, viewed from across Fort Street towards the Detroit River?

The Detroit Copper and Brass Rolling Mill Company was established in 1880 by Christian Buhl (Detroit industrialist and politician) as a follow-on to the Buhl Iron Works. The factory located between Fort Street and West Jefferson Avenue and South Clark and South Mckinstry Streets went through a series of acquisitions and continued on for many years at the site. See Figure 5 for a photograph of the factory taken around 1910. The brass works was acquired by Anaconda American Brass Company in 1927, which was a combination of American Brass Company and Anaconda Copper Company in 1922. American Brass Company was once the largest brass manufacturer in the country with many factories.

The Detroit Brass works was a large foundry (largest in Michigan) casting brass parts in addition to rolled copper and brass sheets. Factory products were supplied largely to the automobile industry. In the early days of the autos, brass ornamentation was the preferred decorative fixture (later, chrome replaced brass as the decorative feature of choice). Detroit Brass was the primary provider of exterior ornamentation and brass engine parts for the Ford Motor Car Company.

The factory would have used large quantities of coal, coke, green mold sand, chemical binders for cores, sand or shot blasting, and cutting, grinding and polishing. Cooling and process waste water would have been discharged directly to the river. There is no evidence of holding ponds for settling and re-use of spend cooling water, which would suggest even higher volumes of discharges to the river. Brass is a blend of copper, lead and zinc which would have been delivered in bulk to the foundry ready to melt in the desired ratios. Slag, waste, and grindings

and spent mold/core sand containing lead and zinc would have been disposed. Notice the piles of ‘sandy’ debris in the foreground of the photo of the foundry in Figure 5.

At some point in the mid-1900s Detroit Brass works closed. Records are unclear exactly when the factory closed, but it appears operations ceased about 1960. Most of the factory has been demolished but portions still exist including an office building which has been designated a Michigan Historic Register site (174 South Clark Street) and is operated as the Detroit Port administrative office (a Wayne County government function).

The company consolidations and acquisitions continued (even if the Detroit factory was no longer part of the equation), in 1977, Anaconda American Brass was acquired by the Atlantic Richfield Company (ARCO). After years of declining profits, ARCO sold American Brass to the Buffalo Brass Company. American Brass was acquired in 1990 by the Finnish Outokumpu Oyj Mining Company. In 2005, American Brass was sold by Outokumpu to the Swedish investment firm Nordic Capital for \$800 million, and was renamed Luvata Brass. In 2011, the company was acquired for about \$370 million by Aurubis AG, a German copper company. Aurubis AG is an existing and viable enterprise with last reported annual revenue of about \$15 Billion.

Buhl Iron Works

Figure 6 – Illustration of the Buhl Iron Works at Larned and Third Streets

The Buhl Iron Works was established in 1880 and succeeded the Detroit Locomotive Works that started at the site in 1854. See Figure 6 for an artist rendering of the factory in the late 1800s. The establishment manufactured and repaired railroad locomotives, various steam engines, and brass and iron castings at the northwest corner of Larned and Third Street (thru to Congress). Records appear to indicate that Christian Buhl (the enterprise founder), quickly established a second enterprise, the Detroit Copper & Brass Rolling Mill a short distance west of the Iron Works.

The enterprise is typical of many early Detroit industrial endeavors, packing a lot of activities into a single location. This factory did iron and brass casting, forging, machining, assembly, and aftermarket repairs and produced locomotives, steam engines and boilers and then all kinds of parts on-order.

Records are unclear as to how long the enterprise lasted, but certainly 30-40 years at the least. The factory no longer exists (it's now the Lodge interchange at Cobo Hall) and no successor entity has been identified.

Peninsular Stove Company ^{1/}

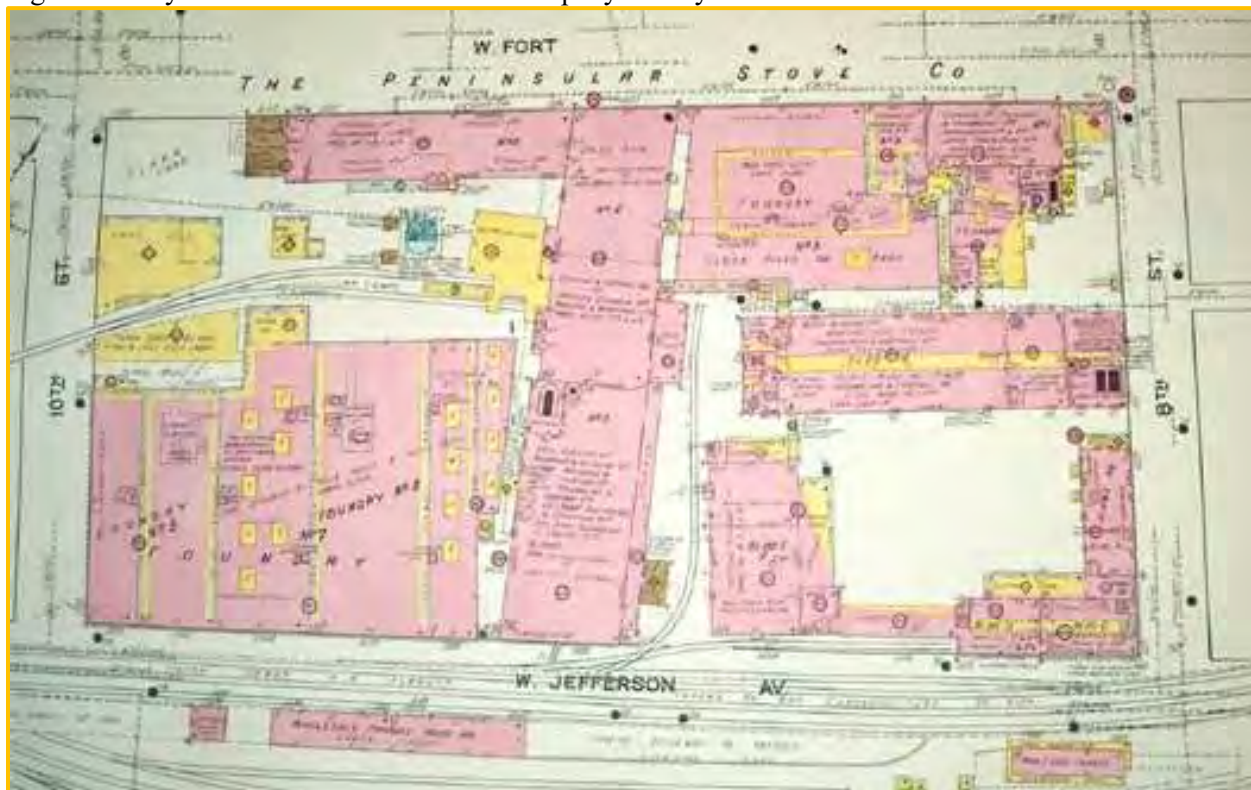

Figure 7 – An illustration from a post card of the Peninsular Stove Company

Manufacturing freestanding cast iron stoves for heating and cooking began in Detroit in 1861 in the Harbortown area. Jeremiah Dwyer was the foundry-man responsible for establishing the first stove manufacturing plants. The Dwyer family was responsible for establishing and operating the three largest, most prolific stove factories in Detroit (and that meant the nation); Michigan Stove Company, Detroit Stove Works, and last, the Peninsular Stove Company in 1881. See Figure 7 for an early idealized illustration of the stove works. These three manufacturing plants (along with several smaller factories) really established Detroit as the stove manufacturing center of the United States. The stoves were originally designed to burn wood but soon included coal, coke, natural gas, and finally electric models. The Peninsular Stove Company was located between West Fort Street and Jefferson Avenue and 8th and 10th Streets until 1920 when it was moved further west to the outskirts of the city. The US Post Office now occupies the site. Peninsular Stove Company closed in 1931 (after 40-years of operation) with no successor entities identified.

The stove factories were a collection of many separate buildings each performing different functions (probably for fire control). The heart of each factory was the foundry for iron casting of stove components. Coke fired iron melt furnaces (cupolas) were used to melt iron for casting molds. See Figure 8 for a Sanborn Fire Insurance map of the Peninsular Stove factory. The molds were the high skill activity of the factories and made of green-sand (sand, clay and coal mixtures). Mold sand was sifted to remove fines and large pieces and re-used. Waste was disposed (on-site fill?). The factories also had plating, finishing (painting), assembly, inspection, packaging, warehousing, shipping, powerhouses, maintenance facilities, showrooms, and business offices.

Figure 8 – Layout of the Peninsular Stove Company factory

Most stoves were highly ornate (style was a major selling feature) with continually changing styles. Extensive nickel plating (and some aluminum) was used to increase ornamentation. See Figure 9 with an example of one of the highly ornate stove. Electroless plating uses tanks of pre-cleaning acid solutions, hypophosphorous acid, and rinses. Spent solutions would have been discharged to the river.

Based upon the duration of operations and activities associated with the stove manufacturing, it is likely that discharges contributed significantly to the volumes and types of contaminants found in river sediments.

Detroit Edison Delray Power Plant ^{m/}

Figure 10 – Delray Power Plant, circa 1953

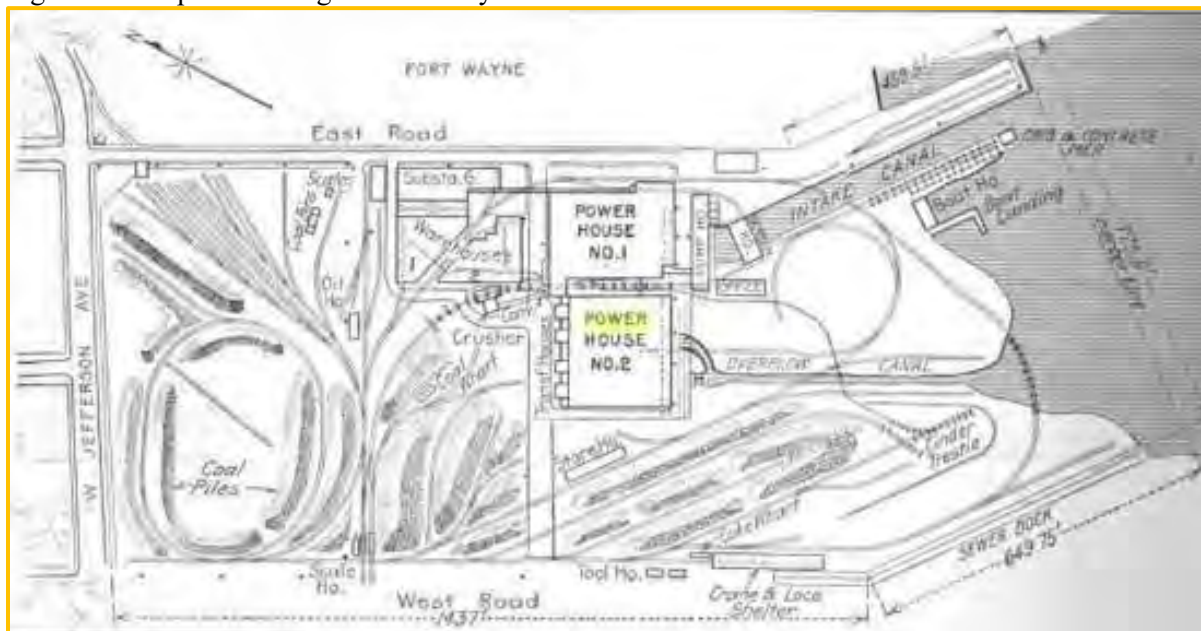

Detroit Edison began construction of its' first power station in 1903 at 6603 West Jefferson Avenue on a 39-acre parcel along the Detroit River. By 1904 this plant's two turbine generators were producing 3,000 kilowatts of electricity each, yet the city of Detroit was growing so rapidly that in 1905 another two turbine generators had to be added, and one more the next year. By 1907 it had become obvious that the company had to add more turbines, and construction began on a second power station at Delray to house a turbine capable of generating 14,000 kilowatts of energy. In 1910 and 1911 two more 14,000 kilowatt turbines were put on line. In 1913 a 15,000-kilowatt turbine was added to the new power house at Delray. At the time the Delray Power Station used relatively new turbine technology (rather than steam boilers) fired with coal. See Figure 10 for a photo of the power plant as it appeared in 1953.

The site of the Delray Power House was selected, in part, because of the availability of water taken and returned to the river. See Figure 11 for a plan drawing showing site details including the first two power houses. There is also mention in the records of the possibility of using excess power house steam to process salt brine (pumped from wells in the area) into saleable salt blocks, but there are no records indicating this ever occurred. Power house operation ceased in 1988 and the site was largely cleared. An electrical substation remains along Jefferson Avenue and two natural gas-fired combustion turbine generators (CTG's) were installed. The CTG's do not operate continuously but are activated during periods of peak electrical demand. The remains of the 'Intake Canal' is now a public access boat launch and the former 'Overflow

Canal’ is merely an indentation in the river shoreline. DTE Energy remains an existing and viable entity with annual revenue over \$10 billion.

Figure 11 – A plan drawing of the Delray Power Plant

Plan drawing of the Delray Power Plant printed in the Power periodical from 1915. Note the ‘Cinder Trestle’ at the right just below the ‘Overflow Canal’ presumably this would have been used to stock pile fly ash along the river edge prior to disposal. Photos reveal large coal piles along the shoreline presumably these were being staged following delivery for movement to the storage piles along Jefferson Avenue. Also, notice the ‘Sewer Dock’ in the lower right...its purpose is undetermined.

It is likely that significant quantities of coal would have been spilled, dumped, and washed into the Detroit River. Coal was delivered to the site by freighter from the Detroit River. The bulk of the coal storage was to be along Jefferson Avenue (see Figure 11), but photographs reveal large coal piles stored immediately adjacent to the river edge with no apparent barrier to pushing, sliding, and washing into the river (see Figure 10 and 12). Also, it appears that fly ash was to be stock piled along the river edge (see Figure 11). Trace amounts of mercury, zinc, copper, boron, lead, arsenic, cadmium, chromium, and selenium are found in virtually all coal and fly ash.

Further, it is likely significant quantities of dielectric, lubricants, and coolant fluids were used at the power plant. PCB dielectric would have been the preferred fluid for electrical generators, switch gears, transformers, and high voltage cable jackets. It is likely that PCB dielectric would have been used at the power plant from their construction in the early 1900s until perhaps as late as 1980 (when the sale was banned, 1979). DTE may have phased-out PCBs prior to or since the 1980s. However, it is probable that PCBs would have been released to the Detroit River from the power plants at least during the early years of operation, before the awareness of the dangers posed by PCB were known.

In an interesting historical side note, construction of the Delray Power Plant destroyed an old Native American land construction known as the Springwells Earthworks (See Figure 3).

Figure 12 – Glamor shot of Delray Power Plant, circa 1953

Glamor photo of Delray Power Plant typical of the era...coal piles on the bank, dark plum from the stack (opacity would be a problem today).

DTE Energy (Michcon & Detroit City Gas Company)

Figure 13 – A section of Sanborn Fire Insurance Map showing some of the Detroit City Gas Co. tanks

Between 1849 and 1889, coal gas usage flourished. The Detroit Gas Light Co. built a second manufacturing plant on West Jefferson Ave. at 21st Street down to 24th Street near the future site of the Ambassador Bridge and extended its gas main to side streets as demand for gas lighting increased. See Figure 13 for a segment of Sanborn Fire Insurance Map showing some of the Detroit Gas Light Co. storage tanks.

The first coal gasification plant in Detroit was established in 1849 on East Jefferson and Meldrum Streets in the Harbortown area by Detroit City Gas Company. The process involved converting solid coal into a carbon rich gas that could be distributed by pipes to burn for light and heat. During the mid-1800s light was provided by burning candles or oil and heating was achieved by burning wood or coal. Coal gas was significantly cheaper than the other fuels and enabled reliable public lighting and a means of illuminating inside factories. By 1851 the first street lights in Detroit were erected on Woodward, Woodbridge and Jefferson Avenues. Demand for coal gas ‘sky-rocketed’ and a second coal gasification plant was built on Jefferson by what is now the Ambassador Bridge.

Coal gas was really the only viable means of providing public lighting and night-time lighting in factories until the 1900s when electricity and incandescent lamps became available. Electric light is far brighter and constant (no flickering as with coal gas) and was quickly adopted as the infrastructure was established to support it. However, coal gas remained viable and active (although declining) well into the mid-1900s. Available records do not indicate how long the coal gasification plant near the Ambassador Bridge operated, but since the bridge was built between 1927 and 1929 it may be assumed that the plant closed before this time. It appears the Ambassador Bridge landing occupies at least a portion of the former coal gasification site.

Significant quantities of waste products are generated by the coal gasification process. Most notable are a variety of coal tars. The tar is rich in hydrocarbons and other chemicals with beneficial properties and operators were always looking for markets to use or process the waste products. The market for tar varied and when plants could not sell tar it had to be stored or dumped. Coal tar sludge has no resale value and so was always dumped. For this site, dumping means the Detroit River. PAH is present in coal tar, gas tar, and pitch at significant concentrations. In addition, waste tars degrade to form phenols, BTEX, and PAH. Other residuals include lead, mercury, and cyanide. The coal gasification plant would have been a significant contributor of sediments in the river containing PAHs.

Also, the coal gasification process reacts coal with oxygen, steam and carbon dioxide to form a gas containing hydrogen and carbon monoxide. During this process, which is essentially incomplete combustion, the heat evolved is consumed and the sulfur and nitrogen in the coal are converted to hydrogen sulfide and ammonia, respectively. At the Harbortown location an ammonia works was established to utilize these by-products. No records indicate a similar facility was established at the Ambassador Bridge location.

In 1937, Detroit City Gas Co., the Grand Rapids Gas Light Co., the Washtenaw Gas Co. and the Ann Arbor Gas Co. merged to become Michigan Consolidated Gas Co. (or MichCon). DTE Energy acquired Michcon in 1999. DTE Energy is an existing and viable entity with annual revenue over \$10 billion that participated in recent soil remediation at the site.

Mistersky Power Plant

Figure 14 – Mistersky Power Plant

The Mistersky electrical power generating plant was completed and operational in 1927 at 5425 West Jefferson Avenue (at Junction Street) to the foot of the river for the Detroit Public Lighting Department. The power plant provided electricity for Detroit City public lighting, City buildings and a few other users and replaced a smaller power plant at Randolph Street and the foot of the river. The plant was expanded several times to add new boilers to keep up with the demand as Detroit grew. The power plant operated on coal until sometime after World War II when it was converted to no. 6 fuel oil (seven large tanks added to store fuel). A natural Gas fired turbine was the final addition. See Figure 14 for a view of the Mistersky Power Plant after conversion to fuel oil. The Mistersky Power Plant reached a peak generating capacity of 184,000 kilowatts in 1979. A long, slow decline of demand, lack of funding, maintenance, and repair ended in 2010 with shut-down of the powerhouse. DTE assumed electrical supply and lighting infrastructure restoration and maintenance.

Detroit and DTE still occupy the Mistersky Power Plant site. DTE has established a ‘tie-line’ (or interchange) that connects the DTE electrical distribution system to the former Detroit Public Lighting Department supply grind at the powerhouse. In addition, the site is used for equipment storage to support DTE maintenance work and new construction activities (site activities are managed by sub-contractors to DTE). Some (not all) of the former oil storage tanks are now owned and operated by Waterfront Petroleum Terminal Company (office at 5431 West Jefferson Ave.), and the remaining tanks are no longer used.

It is likely that significant quantities of coal would have been spilled, dumped, and washed into the Detroit River. Coal storage was immediately adjacent to the river edge with no apparent barrier to pushing, sliding, and washing into the river. In addition, coal handling practices with

open shoveling and scooping of coal would have created large plums of heavy particulate laden dust that would have quickly dropped out on land and water. See Figures 15, 16 and 17 for early photos of coal handling at Mistersky Power Plant. Further, it is unclear what provisions were made for handling, storage, and disposal of the large volumes of fly ash that the powerhouse would have generated. Trace amounts of mercury, zinc, copper, boron, lead, arsenic, cadmium, chromium, and selenium are found in virtually all coal and fly ash.

Further, it is likely significant quantities of dielectric, lubricants, and coolant fluids were used at the power plant. PCB dielectric would have been the preferred fluid for electrical generators, switch gears, transformers, and high voltage cable jackets. It is likely that PCB dielectric would have been used at the power plant from their construction in 1927 until perhaps as late as 1980 (when the sale was banned, 1979). DTE may have phased-out PCBs prior to or since the 1980s. However, it is probable that PCBs would have been released to the Detroit River from the power plants at least during the early years of operation, before the awareness of the dangers posed by PCB were known.

Figure 15 – Mistersky Power Plant coal storage piles, circa 1928

Mistersky Power Plant coal piles at rivers edge, observe scale by truck at upper left. Note the drag bucket at lower right, used to feed coal to the plant. View from the power plant looking southeast towards the Detroit River.

Figure 16 – Mistersky Power Plant coal pile storage, circa 1928

Mistersky Power Plant coal pile storage, large crawler used to stage coal in foreground, neighboring lumber yard immediately to the west across the fence. View from the power plant looking southwest toward the Detroit River at upper left.

Figure 17 – Mistersky Power Plant coal drag bucket in operation, circa 1928

Mistersky Power Plant the drag bucket pulling coal into the power house. Plum of heavy particulate dust would have been typical. Viewed from power house.

Revere Copper and Brass (Michigan Copper & Brass Company)

Figure 18 – Revere Copper & Brass factory

Michigan Copper & Brass Company was established in the early 1900s at 5851 West Jefferson Avenue as a copper and brass foundry. The site was bounded by Jefferson Avenue on the north and the Detroit River to the south and Fort Wayne to the west. In 1928, Michigan Copper & Brass Company was part of a six company merger (including Rome Brass & Copper Company, Baltimore Copper Rolling Mill, Dallas Brass & Copper Co., Taunton-New Bedford Copper Company, and Higgins Brass & Manufacturing Company) forming General Brass Corporation which changed its name a year later to Revere Copper and Brass Incorporated. See Figure 18 for an aerial photograph showing the Revere Copper and Brass factory on the bank of the Detroit River.

Revere Copper and Brass grew to become a fortune 500 company and was the preeminent manufacturer of rolled copper items, copper sheeting, and cookware in the United States. Aluminum and stainless steel were added to the metal mix along the way. By the 1980s the company fell on hard times and the drop in aluminum prices drove Revere Copper and Brass into Chapter 11 bankruptcy in 1982. The company was broken up and many of its factories closed. The former Michigan Copper & Brass Company factory was closed and demolished in 1984. The City of Detroit acquired the property as a potential site for construction of a sewage control facility. It appears Revere Copper Company emerged from the bankruptcy as a smaller employee owned enterprise located at the Rome New York facility, no financial data has been identified. The cookware brand was acquired by a succession of other entities and now only the brand name exists manufactured in China and South Korea (and is no longer manufactured in the United States).

The Detroit factory operated copper and brass furnaces (coke fired), casting, extruding, roll mills, forging, cutting, grinding, finishing and fabrication. With coal fired boilers, maintenance shops, and shipping departments to support operations. During World War II the factory was engaged to manufacture a variety of copper and brass items including cartridge cases. But most importantly, the site was a key player in the Manhattan Project. The factory produced radioactive rods for use in producing plutonium for the atomic bomb. The Center for Disease Control- National Institute for Occupational Safety and Health conducted investigation(s) related to potential worker radiation exposure that provides some insight into activities conducted at the plant.

“The primary radioactive materials at Revere were natural uranium and thorium metals existing either separately or as alloys. Revere’s main function was the extrusion of uranium billets into rods and various other shapes for use by Hanford, Savannah River Site, and Oak Ridge National Laboratory (ORNL). During 1943 and 1944, under the MED contract, Revere extruded approximately 2,695,205 lbs. of billets. Even though there was strict accountability of the metal, the total quantity of material processed over the period under evaluation is not accurately known. Thorium was extruded on an intermittent basis and the amount of thorium extruded is also not known. Additional work on the extrusion, shaping, and machining of uranium and thorium was done intermittently through 1954 (Fisher, 1954; Montenyohl, 1952; Various Authors, 1949-1952).

The plant consisted of four buildings, including the Foundry building, the physical/chemical labs/machine shop building, the Extrusion Area building, and a smaller building that may have been used for offices. The portions of the site that are of particular interest in terms of potential radiological contamination are two extrusion presses and a furnace, all housed in the Extrusion Area building, as well as the high bay area of the Extrusion Area building that would have been susceptible to the accumulation of radioactive dust due to airborne contamination (DOE, 1990).

During the fabrication process, the billets would first pass through a gas furnace where they were heated to the desired temperature. They were then removed and taken to the extrusion machine. After extrusion, they went to a rolling table where they were partially straightened and allowed to cool to a certain extent. Following partial cooling, they were quenched in a water-filled basin, after which they were placed in another tank containing a 10 % sulfuric acid solution to remove the oxide that was formed during extrusion. At times, the operator used a brush to clean the oxides from the rods. The rods were then hosed off with fresh water. The rods were then removed to a rack where they were numbered and then packaged in boxes for shipping (Nickson, 1944). During each of these processes there was the possibility of airborne dust or fumes that potentially contained uranium metal. In particular, during the extrusion process and the brushing of the rods to remove the oxides, uranium oxides were a significant source of airborne contamination and potential internal exposure to workers.

The 1954 thorium extrusion operation ended the extrusion program at Revere. The residual period started on January 1, 1955 and continued until December 31, 1984, the year the facility was demolished.”

The extracts from the CDC-NIOSH documents (above in *italics*) convey the nature of the radioactive material processing. There are also separate references to the methods used to minimize worker exposure. These were basically ventilation to exhaust dust from the work area and water washes to rinse-off particulate. Those practices address immediate worker exposure, but resulted in environmental discharges. Wash water would have been discharged to the river and ventilation exhaust would have resulted in heavy particulate fall-out in the immediate area and precipitation washing into the river. It appears likely that some level of radiation contamination probably exists in river sediments. This period was at the dawn of the ‘atomic’ age and many of the dangers and safety practices now in place were just being identified and developed. Revere was under direct contract from DuPont (who was leading the project for the US government). DuPont established the manufacturing processes and operational practices.

In addition, the factory would have used large quantities of coal, coke, green mold sand, chemical binders for cores, sand or shot blasting, and cutting, grinding and polishing. Cooling and process waste water would have been discharged directly to the river. There is no evidence of holding ponds for settling and re-use of spent cooling water, which would suggest even higher volumes of discharges to the river. Brass is a blend of copper, lead and zinc which would have been delivered in bulk to the foundry ready to melt in the desired ratios. Slag, waste, and grindings and spent mold/core sand containing lead and zinc would have been disposed.

An industrial waste survey report by the US Department of Health in 1965 revealed Revere factory discharged total solids discharges to the Detroit River of more than 1 ½ tons per day, and oil of over 360 gallons per day.

Michigan-Peninsular Car Company (Michigan Car Company and Detroit Car Wheel Company, ACF Industries LLC) ^{o/}

In 1892 several companies, including the Michigan Car, Peninsular Car, the Russel Wheel and Foundry and the Detroit Car Wheel Companies merged to become the Michigan-Peninsular Car Company. The main location of the enterprise was at Railroad Junction and Springwells (Lonyo Avenue and Dix Street) on 30-acres. This is approximately 2-miles inland from the Detroit River. The site produced thousands of railcars annually and was the largest manufacturer of railcars in the late 1800s. By the 1890s it was the largest industry in Detroit.

Site operations included foundries, forges, metal machining, assembly, and finishing using large quantities of coal, coke, ferrous and non-ferrous metal (copper, lead, zinc, and brass), machining lubricants (oil), and lacquer and varnish finishes. Large quantities of process water would have been consumed and discharged. As was common practice during this period, one or more sewer lines would have been employed to direct oily, heavy metal laden waste water to the either the Rouge River or the Detroit River. This operation predates all available sewer records that might indicate the actual discharge location. However, other records indicate sewers in the area all flowed by gravity to the Detroit River, which would have discharged in the River Bend Target Area.

A succession of mergers and consolidations in the railcar industry resulted in the Michigan-Peninsular Car Company being adsorbed into The American Car and Foundry Company (ACF) in 1899. Further consolidations and labor issues in Detroit drove most of the railcar industry to other states. American Car and Foundry Company is now ACF Industries LLC owned by Carl Icahn, an existing and viable privately held company.

Solvay Process Company (Semet-Solvay Company, Allied Chemical Corporation, Honeywell) ^{q/t/}

Figure 19 – Solvay Processing areas

Photo (1930's) looking East over Zug Island in the foreground is a residential neighborhood of Delray and commercial buildings along West Jefferson Avenue, this ground is now occupied completely by the Detroit Wastewater Treatment Plant. In the center is Peerless Cement and on the right edge is Scott Paper. Across the Old Channel is an exceptionally good view of the Solvay process tanks and ponds, notice the center pond is completely open to the Old Channel. In the upper left corner some of the Allied Chemical facilities spreading inland from the North bank of the Old Channel.

The Solvay Process Company purchased the Detroit International Exposition Fair grounds at the junction of the Detroit and Rouge (old channel) Rivers from Jefferson Avenue to the foot of the Detroit River in 1895. Later the Solvay Process Company would acquire about half of Zug Island for processing plants and waste ponds. The location was selected because of the presence of salt brine that could be extracted by wells. Salt with lime stone and ammonia was used by the Solvay process to manufacture caustic soda (used for making glass). Ammonia was obtained as a by-product of coke manufactured by the Semet-Solvay Company. Both the Solvay Process Company and the Semet-Solvay Company were absorbed by the Allied Chemical and Dye

Corporation in 1920. Allied Chemical became Allied Corporation in 1981. In 1985, Allied merged with the Signal Companies to become AlliedSignal. In an unrelated action AlliedSignal acquired Honeywell in 1999 and then adopted its name. See Figure 19 for an aerial view of the Solvay processing areas.

Various chemical manufacturing activities were performed along the North bank of the Old Channel and the Western portion of Zug Island. Operations included soda ash manufacturing, coke batteries, ammonia, coal tar, pitch and creosote manufacture and storage of coal, limestone, salt, coke, and various intermediate and finished products in tanks and open piles.

Honeywell International is the current owner of the now discontinued chemical manufacturing operations. Most of the manufacturing facilities have been removed and disposed. The various chemical manufacturing operations occurred along the Old Channel for almost a hundred years and included bulk tank storage capacity of several million gallons of pitch, tar, creosote and associated liquid and semi-liquid products. In addition, coal for process heating and the coke batteries was extensively used at the site. Material was loaded and unloaded from and to barges and freighters at wharfs along the North bank of the Old Channel. Trains were used extensively at the site to move products to market. See Figures 20, 21 and 22 for early photos of the Solvay facilities in Delray.

Soda ash was produced at the site using the Solvay process. The soda ash was primarily supplied to others for the manufacture of automobile glass. The Solvay process generated significant quantities of wastewater that was discharged into basins and impoundments formed in low, marshy areas of Zug Island. The waste impoundments flowed directly into the Old Channel as clearly illustrated by aerial photographs taken during the first half of the 20th century. The Zug Island wetlands have all been filled with manufacturing process wastes.

Around 1923 a ‘shortcut’ channel was dredged to straighten the Rouge River flow into the Detroit River effectively changing the direction of water flow in the Old Channel. Until this time, Rouge River flow in the Old Channel would have carried sediments into the Detroit River at the mouth of the Old Channel. After this time, the Old Channel flow was reversed and sediments would flow toward the Shortcut Channel and into the Detroit River.

An industrial waste survey conducted at Allied Chemical operations during 1963 (with plant personnel participation) revealed total solids discharges to the Detroit River via Rouge River outfalls of more than 65 tons per day, phenols at about 1,000 pounds per day, cyanide of over 200 pounds per day, and chloride of over 330 tons per day.

Honeywell operated three hazardous waste injection wells beginning in 1969 and ending in 2008. All three wells are in the process of being (or have been) administratively closed.

The Solvay processes were certainly significant contributors of sediments and contaminants of the type identified in Detroit River. Honeywell International is an existing and viable entity with annual revenue of over \$40 Billion (2017) and has engaged in remediation of industrial activities at the site previously.

Figure 20 – The Solvay Process Company offices in Delray

Figure 21 – Solvay Process Company facilities on Zug Island

Figure 22 – Semet-Solvay Process Company facilities

Semet-Solvay Process Company coke batteries, used to make coke and ammonia needed for caustic soda production, also made coal tar, pitch and creosote. Located on the northeast side at the mouth of the Rouge River (Old Channel) and Detroit River

Detroit and Lake Superior Copper Company^{2/}

Figure 23 – An illustration of the Detroit and Lake Superior Company Detroit Smelter facility

Figure 24 – The Detroit Smelter

An early photo of the Detroit Smelter circa 1860s viewed from the Detroit River side of the dock looking inland (north). The photo confirms the illustration (Figure 23) and shows the six furnace stacks, copper ore to the right (perhaps coke at the end), barrels contain refined copper, blocks in foreground are probably refractory for the furnaces.

The Detroit and Lake Superior Copper Company established a copper smelting facility in 1850 at Springwells and the foot of the river (near Fort Wayne) and had four reverberatory furnaces and two cupolas. See Figure 23 for an artist rendering of the smelter and Figure 24 for an early photograph. The Detroit and Lake Superior Copper Company also owned a copper mine and smelter at Hancock on Lake Superior. The refining of copper was performed to supply industry in Detroit and to ship copper to global markets. By the late 1800s the Detroit smelter was producing about 10,000 tons of refined copper annually. The Detroit smelter closed after operating for 37 years in 1887 when a new smelter at Torch Lake near the copper mine(s) in the Upper Peninsula went on-line.

Wastewater from copper smelting contains dissolved and suspended solids that may include concentrations of copper, lead, cadmium, zinc, arsenic, and mercury and has historically been a major source of contamination. The Detroit smelter would have been a significant contributor of sediments and contaminants of the type identified in Detroit River. However, the Detroit and Lake Superior Copper Company no longer exists. A long history of closures, acquisitions, and consolidations surround the copper mining business in Michigan with the mines now owned by multi-national corporations (bought and sold many times). The Detroit and Lake Superior Copper mines certainly still exist (although not operationally) and the Torch Lake smelter was abandoned (and is a major contamination site undergoing remediation), but the company has disappeared, probably around the time of the Great depression in the early 1900s. No clear successor entity has been identified from available records.

Detroit White Lead Works

The Detroit White Lead Works was a paint manufacturer specializing in lead and zinc based paints located at what is now Michigan Ave and US-10 (Lodge Freeway). The site is now occupied by MGM Grand Detroit Casino. The enterprise was established in 1879 and by the late 1800s was using over 1 million pounds of lead annually. Not surprisingly, their offices were located at some distance away at 97 West Jefferson Ave. Fire burned the factory to the ground in 1897, which was rebuilt on Milwaukee Avenue and continued to operate until sometime in the mid-1900s. Started as an architectural paint supplier and moved into the automobile business providing paints to such manufacturers as Dodge, Pontiac-Oakland, De Soto, Packard, and Studebaker. Paints sold under the Rogers Paint Products label.

Based upon the nature of the Detroit White Lead Works manufacturing and duration of operations (20-years at the MGM site), it is likely that the factory contributed significantly to contaminated sediments present in the river. However, no records of Detroit White Lead Works or Rogers Paint Products could be identified beyond the mid-1900s and it appears to no longer an existing or viable enterprise. No successor entity has been identified.

Greenfield Tap and Die Corporation (Kennametal, Inc.)

A tap and die tool making enterprise was established at 2102 West Fort Street sometime in the early part of the 1900s. The records are not clear on who established the enterprise, but it was acquired by Greenfield Tap & Die Corporation (out of Massachusetts). By 1958 Greenfield Tap & Die Corporation had been acquired through a series of mergers, ownership and organizational changes by Kennametal, Inc. a large multi-national tool and die manufacturer headquartered in Pennsylvania. The Detroit factory operated through World War II producing ground thread high speed taps, but no longer exists.

The grinding, machining, and finishing operations performed at the Greenfield Tap & Die factory would have generated oily waste water with heavy metal particulate from cutting and cooling tools that would have been discharged to the Detroit River. However, it is unlikely that this operation would have contributed significant quantities of contaminants to existing river sediments. Kennametal, Inc. is an existing and viable enterprise with annual sales of over \$2 Billion.

United Drill and Tool Corporation

United Drill and Tool Corporation is another of the many Detroit tool making enterprises, this one was established at 2108 West Fort Street sometime in the early part of the 1900s. The records are not clear on when the enterprise was established. There are records of legal action by the US government to recover overpayment for contracts paid during World War II in the 1950s. The Detroit factory operated through World War II producing twist drills, reamers, countersinks, counterbores, and other specialized cutting tools, but apparently no longer exists.

The grinding, machining, and finishing operations performed at the United Drill and Tool factory would have generated oily waste water with heavy metal particulate from cutting and cooling tools that would have been discharged to the Detroit River. However, it is unlikely that this operation would have contributed significant quantities of contaminants to existing river sediments. Records reveal no successor entity.

Detroit Harvester Company (Dura Co., Collins & Aikman Corporation)

Detroit Harvester Company was established sometime during the early 1900s at 5440 West Jefferson Avenue and manufactured tractor attachments, primarily cutting implements and later manufactured lawn mowers in addition to tractor PTO implements. During World War II the factory made aircraft engine parts and other machined parts. After World War II the enterprise began to diversify and a confusing series of acquisitions and mergers unfolds. Motor State Products was acquired by Detroit Harvester Company in 1946, but Motor State Products acquired The Dura Company of Toledo, Ohio in 1936. The Dura Company specialized in manufacturing window regulators for automobiles. With this portfolio of companies, Detroit Harvester Company grew and adopted the name Dura Corporation in 1958. At some point Dura

Corp. started making automobile convertible tops which made it attractive to Collins & Aikman (a large automobile interiors supplier).

Collins & Aikman Corporation was an automotive manufacturer of cockpit modules and automotive floor and acoustic systems and a supplier of instrument panels, automotive fabric, plastic based trim and convertible top systems. The Company's operations spanned 15 countries, incorporating about 120 facilities and approximately 25,000 employees. It entered Chapter 11 bankruptcy in 2005 and went out of business in 2007. No successor entities have been identified, but it is likely that Collins & Aikman assets were broken up and sold to other auto suppliers. The Detroit Harvester factory no longer exists. This is typical of many, if not most, industrial enterprises that once existed in the Riverbend Area.

The metal manufacturing, fabrication, assembly, and finishing activities engaged in at the Detroit Harvester factory would have resulted in waste water containing contaminants identified in river sediments and may have been a significant contributor, but there remain no viable successor entities to link the operations to.

Kelsey-Hayes Wheel Company (ZF Friedrichshafen AG)

Kelsey-Hayes was established in 1927 through the merger of Kelsey Wheel and Hayes Wheel. Both companies were founded in 1909, and both had made early advances in the wooden wheel industry. Kelsey-Hayes moved quickly into steel wheel and brake manufacturing and virtually cornered the business of wheel and brake manufacturing in the automobile business, but also made airplane wheels, brakes and jet engine parts. Kelsey-Hayes had dozens of factories around Detroit and eventually the world. Among the first and significant manufacturing sites were at 3600 Military Street and at the intersection McGraw and Livernois Road. These locations are about 2 to 2 ½ miles inland from the Detroit River, but are immediately adjacent to the Livernois Relief sewer that carries waste water directly to the river down Livernois Road.

The Kelsey-Hayes factories were steel foundries, forges, machining and assembly operations and would have generated significant amounts of oily, heavy metal containing waste water that would have been dumped into the sewer going directly to the Detroit River with virtually no pretreatment. The Detroit River Interceptor sewer was completed in 1937 to divert direct river discharges to the Rouge River area for treatment prior to discharge. However, connections to the Detroit River Interceptor (and construction of primary waste water treatment facilities) were phased in over several years. Consequently, Kelsey-Hayes factories could have been discharging untreated waste water to the Detroit River for 30-years or more.

As with most early manufacturers in Detroit, Kelsey-Hayes passed through a series of mergers and acquisitions over its history. Kelsey-Hayes Company no longer exists. Kelsey-Hayes merged or was acquired by Freuhauf, Toronto-based Varsity Corporation (the former Massey-Ferguson), London-based LucasVarsity, TRW, and finally the German car parts maker ZF Friedrichshafen (ZF).

ZF's shareholders are the Zeppelin Foundation, administered by the City of Friedrichshafen, holding 93.8 percent of the company's shares, and the Dr. Jürgen and Irmgard Ulderup Foundation Lemförde, with 6.2 percent. In 2017, ZF achieved sales of over \$41 Billion and as such, is one of the largest automotive suppliers worldwide. ZF is existing and viable.

At some point after 1970 (available records are not clear when), the former Kelsey-Hayes factories along Livernois Road/Military Street were closed. Most (or all) of the factories at McGaw and Livernois Road have been demolished. The sturdy Albert Kahn designed Kelsey-Hayes factory at 3600 Military Street is now occupied by Olympic Steel (processes rolled sheet metal by blanking, slitting and cutting).

Michigan Malleable Iron Company

Figure 25 - Michigan Malleable Iron Company

An early photograph of the Michigan Malleable Iron Company factory in Delray

Michigan Malleable Iron Company established a grey iron foundry in the then City of Delray between Crossley and Anderson Streets in the late 1800s. The foundry was a job shop providing iron castings to a variety of customers. The foundry was large and successful employing hundreds of men (primarily Hungarian immigrants) for many years. It appears the company operated several foundries around Michigan. See Figure 25 for an early photo of the Michigan Malleable Iron Company street-side façade (the factory extended out the back).

The foundry and machining operations would have resulted in significant quantities of waste water (primarily cooling water) containing heavy metals discharged directly into the Detroit River. The enterprise closed around 1960. No successor entities have been identified.

US Steel (Detroit Iron & Steel, National Steel) ^{a/t/}

Figure 26 – US Steel on Zug Island

Photo of Zug Island (1973), view from the northeast looking southwest, with the Great Lakes Works to the left and the coke battery (DTE) in the center. The Rouge River Old Channel is in the foreground, Solvay coke plant this side of the Rouge, and the Solvay process ponds are on the upper right.

Detroit Iron & Steel Company began Great Lakes Works operation on Zug Island in 1902. Since start-up, operations have changed hands several times and are now owned and operated by US Steel. Steel manufacturing consumes large quantities iron ore, scrap steel, limestone, coal, and coke that are delivered to the facility by freighters at wharfs on the Old Channel and Detroit River. See Figure 26 for an aerial photo of Zug Island from 1973.

US Steel purchased the Great Lakes Works from the bankrupt National Steel Company. US Steel operates the blast furnaces and transports the molten steel by rail to manufacturing facilities located South of Zug Island in River Rouge. Steel manufacturing has been performed at the site for over a hundred years. Large stockpiles of coal are maintained on the island in open piles that extend down to the very edge of the Old Channel with seemingly little run-off protection.

An industrial waste survey conducted at National Steel Great Lakes Works during 1963 (with plant personnel participation) revealed total solids discharges to the Detroit River via two outfalls of more than 19 tons per day, iron at about 1 ton per day, and oil of over 375 gallons. In addition, the Great Lakes Works currently direct discharges cooling water to the Old Channel with measurable concentrations of oil & grease regularly reported. The Great Lakes Works is a contributor of contaminants of the types identified in river sediments at significant volumes. US Steel is an existing and viable enterprise with annual revenues of over 12 Billion (2017).

Fruehauf Corporation

The Fruehauf Trailer Company was established in 1918 in Detroit (on the east side) to manufacture trailers for the emerging automobile/truck industry. Fruehauf grew to become the leading semi-trailer manufacturer in the world by the 1950s (out producing virtually all other trailer manufacturers combined and had factories across the country and worldwide) and was heavily engaged in military contracting (supplying all sorts of trailers through World War II and beyond including ballistic missile launchers and space recovery vehicles). One of the trailer factories was located at 138 South Junction Street in the Riverbend Area. It appears to have operated during the mid-1900s. The building still exists (at least in part) and appears to have last been used as a warehouse by Hascall Steel Company (a small sheet metal supplier to the automobile industry primarily, specializing in cutting, splitting, blanking, and just in time supply).

The Fruehauf Trailer Company became Fruehauf Trailer Corporation and then just Fruehauf Corporation over the years. As is the case with many family owned businesses, the original innovation and drive faltered with subsequent generations and mismanagement drove the company to bankruptcy. A leveraged buyout in 1986 by the company's management left Fruehauf burdened with debt, and in 1989 the company was broken up and sold, though one segment, the truck trailer unit, retained the name Fruehauf Trailer Corporation. That corporation declared bankruptcy in 1996 and was sold to Wabash National the next year. Wabash National Corporation is now the largest semi-trailer manufacturer in the country is existing and viable with annual revenue of close to \$2 Billion. Wabash National has no manufacturing presence in Detroit. Linkage of the South Junction Street factory to the Wabash National acquisition has not been established.

Letts Industries (Letts Drop Forge, Detroit Socket Company)

Detroit Socket Company was established in 1909 at 2714 West Jefferson Avenue (just east of what is now the Ambassador Bridge). As a supplier of buggy and wagon top hardware, Detroit Socket Company forged, welded and Japanned (painted) bow sockets (a metal 'cup' to catch supple wood that is bent from one side of the wagon to the other to support a canvas or leather cover) and rests. In 1913, Charles E. Letts, Jr. was hired as a salesman. One of his duties was to make horse-drawn deliveries to Ford Motor Company. He must have sold a lot of parts because, in 1915, he was named president and general manager of the Detroit Socket Company.

During World War I, the Detroit Socket Company supplied parts for the "F" boat (predecessor to the PT boat). In 1919, Charles E. Letts, Jr. purchased the remaining stock in the Detroit Socket Company. In 1929 the company name was changed to Letts Drop Forge. At some point the name was changed to Letts Industries (perhaps to reflect the other interests the company became involved in). Letts Industries is engaged in metal part fabrication and industrial equipment sales through its two groups (four divisions).

The West Jefferson Avenue forge factory was closed and has been demolished. It appears Powers and Sons is currently manufacturing the drop forged parts sold to the auto industry.

Aerial photos indicate that demolition of the factory began around 2000 and was completely gone before 2016 (it's a cleared lot today).

Today, Letts Industries appears to be a holding company. Manufacturing is comprised of Powers and Sons and Trek; Product Services includes Pioneer Forge and Letts Equipment. Powers and Sons unit makes steering and suspension parts for cars and light-, medium-, and heavy-duty trucks. Products include pitman and idler arms, track bars, and rear tow links. Letts Industries also serves as a US sales outlet for solid metal forming and powder metal compacting equipment made by Germany-based LASCO. Letts Industries is headquartered at 1111 Bellevue Street (Harbortown Area) and appears to remain economically viable as a privately held company. The following article appeared in Crain's Detroit Business Publication and sheds some light on how the prissy little, self-entitled "Chip" views the enterprise his great-grandfather worked so hard and devoted his life to create and handed down to his heirs so they wouldn't have to work...

If an apple a day keeps the doctor away, Charles Letts figured a bushel basket of apples keeps a company in good stead with Ford Motor Co. and its founder, Henry Ford.

"My great-grandfather brought him a basket of them for Thanksgiving or something, and he just kept it up," said Charles "Chip" Letts III, CEO of Letts Industries Inc. "Then Henry Ford II took over, and I think they wondered who the old guy with the apples was."

Letts, which is still in Detroit on Bellvue (SIC) just north of Lafayette, is one of the oldest suppliers to Ford Motor. It began supplying forgings to the automaker in 1915. In fact, Charles Letts used to load all the forgings made during the week into a horse-drawn carriage and take them over to the Ford plant in Highland Park.

"Henry Ford would come out and sign for them personally," said Chip Letts. "My great-grandfather would take the signed receipt down to the bank and borrow money off Henry's signature to pay the workers who made the forgings."

Since 1915, Letts Industries has made everything from simple rails in the early days to steering and suspension components for the current iteration of Ford's Superduty pickup truck.

Letts Industries was one of the first automotive suppliers that went through a union organization. In 1936, future UAW President Walter Reuther organized the plant, which used to be on Fort Street where the foot of the Ambassador Bridge now sits.

"We've had a long history with them," Letts said adding that Ford accounts for 75 percent of the company's business. In 2002, its revenue was \$80 million.

"They keep throwing business our way," Chip Letts said. "We're not big enough to turn them down. We've been expanding with Chrysler and other business, but for so long they've been a dominant player for us."

Michael Strong: (313) 446-6796, mstrong@crain.com

Fisher Body Plant 18 (aka Cadillac Fleetwood Plant)

Figure 27 - Fisher Body Plant #18

Fisher Body Plant #18 after World War II producing car bodies for the Clark Street Cadillac Assembly Plant

Fisher Body Company was established in 1908 to manufacture automobile bodies for the emerging automobile industry. The company's background was in wood fabrication of carriage bodies and specialized in creating standardized and replaceable wood parts. The company quickly moved to metal body fabrication to provide the rigidity needed for automobiles and became the premiere automobile body manufacturer in the industry.

Separately, the US Government started construction of a single storied building at 261 West End Ave. at the corner of West Fort St. in Delray, Michigan to manufacture aircraft in 1916. The manufacturing building was designed by Albert Kahn and a contract was granted to Fisher Body to manufacture World War I aircraft at the factory. Thousands of aircraft were manufactured at the site by the end of World War I in 1918.

After World War I ended Fisher Body Company purchased the factory from the US Government to make automobile Bodies.

The Fisher Body Company continued to expand and supply a large portion of the emerging automobile body business. The former aircraft factory in Delray would manufacture Ford,

Dodge, and Chrysler-Maxwell bodies until Fleetwood was given the plant in 1926 and was designated Fisher Body Plant #18.

Fisher Body purchased Fleetwood Metal Body Company (a metal automobile body manufacturer out of Pennsylvania) in 1925 and moved the operation to Plant #18. LaSalle bodies were built there through 1940 after which the plant turned to war work. During World War II a variety of B-25, B-29, B-17, XP-75, XB-19, XB-39 Aircraft Parts and assemblies; M4, M10, M26 Tank Parts; Universal Drop Fuel Tanks; P-80 aircraft (Tools); 90mm AA Guns (Tools); Combat Vehicle Parts were manufactured at the plant. In 1946 it returned to manufacturing bodies for Cadillac, producing about 200,000 per year during its years of peak activity. The car bodies were shipped by rail and then truck to the Cadillac Assembly Plant a couple miles to the east at Clark Street and Michigan Avenue. See Figure 27 for a street level photo of the Fleetwood Body Plant. Fisher Body Company was adsorbed into General Motors in 1984. Plant #18 was closed down when Cadillac's modern Hamtramck assembly plant opened up in 1985, and was eventually torn down in 1993.

The factory operated for close to 70-years manufacturing planes, parts, tools and automobile bodies. Activities would have included, metal stamping, machining, cleaning and coating involving significant quantities of drawing compounds, cooling and hydraulic fluids, cleaners and paints that would have generated process waste water. It was common practice prior to the later 1930s to discharge untreated waste water directly to the Detroit River. Available records indicate sewers flow almost exclusively from north to south (most direct path to the Detroit River) and few from east to west (the Rouge River). It is therefore likely that large volumes of oily, greasy heavy metal laden (including nickel, zinc and chromium) waste water would have been discharged to the Detroit River from Plant #18 and would have been a significant contributor of the types of contaminants identified in the river. Fisher Body and its successor organization GM operated the factory during this period. However, GM went through Chapter 11 bankruptcy in 2007 and reorganized in 2010 leaving legacy liability behind. GM is currently an existing and viable entity with annual revenue of \$145 Billion (2017).

The former Plant #18 site was taken over by ContainerPort Group (an intermodal shipping company) in 1996 and continues to operate at the site today. ContainerPort Group Inc. is an existing and privately held company (financial information is not available).

Timken Detroit Axle (Meritor, Rockwell International)

Figure 28 – Timken Detroit Axle factory

Timken Detroit Axle Company was established in 1909 on Clark Street just south of West Fort Street. The enterprise was a drop forge factory manufacturing axles and other drive train components for automobiles. Later other drive train components were added for automobiles and trucks and became heavily involved in supplying military equipment. See Figure 28 for a photograph of the Timken Detroit Axle plant taken around 1920. The company grew quickly along with the auto business and acquired a similar manufacturer located in Wisconsin in 1919. Importantly, the Wisconsin company was headed by Willard Rockwell who soon became CEO of Timken Detroit Axle, important because this is the Rockwell that grew the company into Rockwell International (maker of the Space Shuttle, B-1 Bomber, etc.). Rockwell International spun-off the automobile business in 1997 that became Meritor, Inc., a fortune 500 company with annual revenue of over \$3 Billion.

The Clark Street axle factory operated into the late mid-1900s and then was closed and demolished (it would have been a Rockwell facility at the time). See Figure 29 for an aerial photo showing the Timken Detroit Axle plant in 1949. The site is currently an open field. However, the more than 50-year history of manufacturing at the Clark Street factory would have resulted in sewer discharges of oily, heavy metal containing waste water that could have significantly contributed to the types and quantities of sediments identified in the Detroit River. Meritor would be the successor entity for the Timken Detroit Axle plant.

Figure 29 – The Timken Detroit Axle Plant

Carter Industrials, Inc.

A scrap metal and salvage yard was established in 1966 at 4690 Humboldt Street. The salvage yard was operated as Spector-Carter Metal until 1971 when ownership changed and became Carter Industrials, Inc. The enterprise handled a variety of scrap metal including electrical capacitors and transformers. The dielectric fluid in the electrical equipment was drained, spilled, dumped, and otherwise accumulated on site until Carter Industrials went out of business in 1986.

Investigations beginning in 1986 by MDEQ (MDNR) and followed by US EPA revealed the presence of significant quantities of PCB, cadmium, lead, and arsenic throughout the 3.5-acre property and beyond to adjacent property, alleys, streets and combined sewer (along 18th Street) discharging directly into the Detroit River. Contaminated sediments in the 18th Street sewer were found to contain close to 5,000 mg/kg of PCB.

The former salvage yard was listed as a Superfund Site and contaminated materials treated, removed and disposed off-site, and permanent on-site containment. Remedial activities included removing PCB contaminated sediments from approximately 1.25 miles of the 18th Street sewer. The Carter Industrials salvage yard is located over 2 ¼ -miles inland from the Detroit River. However, because of the direct connection provided by the 18th Street sewer it is likely that contaminated sediments containing PCB and possibly cadmium, lead, and arsenic were discharged directly into the Detroit River during the 20-years of operation.

Carter Industrials, Inc. no longer exists and no successor entities have been identified. EPA took the site off the Superfund program's National Priorities List (NPL) in 1997.

5.0 Potential Partner Identification for each site

Detroit River AOC – Riverbend Target Area – Potential recruitment Partner Matrix

Map Key	Identified PRP	PRP Operation	PRP Address	Successor Entity	Address	Comments	Assessment
1	Anaconda American Brass Company	Copper & Brass Foundry	Fort Street and West Jefferson Avenue and South Clark and South Mckinstry Streets	Aurubis AG		The Detroit Brass works was a large foundry (largest in Michigan) casting brass parts in addition to rolled copper and brass sheets.	Likely a significant contributor of the type of contaminants found in river sediments. Aurubis AG is an existing and viable enterprise with last reported annual revenue of about \$15 Billion.
2	Buhl Iron Works	Locomotive and steam engine manufacturer	Northwest corner of Larned and Third Street	None		This factory did iron and brass casting, forging, machining, assembly, and aftermarket repairs and produced locomotives, steam engines and boilers and then all kinds of parts on-order.	Records are unclear as to how long the enterprise lasted, but certainly 30-40 years at the least. The factory no longer exists (it's now the Lodge interchange at Cobo Hall) and no successor entity has been identified.
3	Peninsular Stove Company	Stove Manufacturing (Grey Iron Foundry, Plating)	West Fort Street and Jefferson Avenue and 8 th and 10 th Streets	None		US Post Office now occupies the site.	Likely a significant contributor of the type of contaminants found in river sediments. No successor entity identified.
4	Detroit Edison Delray Power generation Plant	Electric Power Plant	6603 West Jefferson Avenue	DTE Energy		Coal powered electrical generating plant on the banks of the Detroit River.	Likely a significant contributor of the type of contaminants found in river sediments. DTE Energy remains an existing and viable entity with annual revenue over \$10 billion.
5	Detroit City Gas Company	Coal Gasification Plant	West Jefferson Ave. at 21 st Street down to 24 th Street	DTE Energy		PAH is present in coal tar, gas tar, and pitch at significant concentrations. In addition, waste tars degrade to form phenols, BTEX, and PAH.	Likely a significant contributor of the type of contaminants found in river sediments. DTE participated in soil remediation at Harbortown gasification site.
6	Mistersky Power Plant	Electric Power Plant	West Jefferson Avenue at Junction Street	DTE Energy & Waterfront Petroleum Terminal	WPT - 5431 West Jefferson Ave.	Coal powered electrical generating plant on the banks of the Detroit River. WPT operates fuel tanks.	Likely a significant contributor of the type of contaminants found in river sediments.
7	Revere Copper & Brass Company	Copper 7 Brass Foundry	5851 West Jefferson Avenue	None (DuPont)		Processed uranium rods for the World War II Manhattan Project (1943 thru 1954). Uranium particulate ventilated and washed off. DuPont directed radiation handling.	Likely a significant contributor of the type of contaminants found in river sediments. Need to investigate for radioactive waste in river sediments.
8	Michigan-Peninsular Car Company (ACF)	Railcar Manufacturing	Lonyo Ave. & Dix Street	ACF Industries LLC		About 2-miles inland from the Detroit River. The site produced thousands of railcars annually and was the largest manufacturer of railcars in the late 1800s. It was the largest industry in Detroit in the 1890s.	May have been too far inland to be identified as a significant contributor to river sediments. ACF Industries LLC owned by Carl Icahn, an existing and viable privately held company.

Continued...

Map Key	Identified PRP	PRP Operation	PRP Address	Successor Entity	Address	Comments	Assessment
9	Solvay Process Company (Honeywell)	Caustic Soda, Coke & Chemical Manufacturing	Junction of Detroit & Rouge (Old Channel) Rivers	Honeywell		An industrial waste survey conducted at Allied Chemical operations during 1963 (with plant personnel participation) revealed total solids discharges to the Detroit River via Rouge River outfalls of more than 65 tons per day, phenols at about 1,000 pounds per day, cyanide of over 200 pounds per day, and chloride of over 330 tons per day.	Likely a significant contributor of the type of contaminants found in river sediments. Honeywell participated in soil & sub-surface remediation at the site. Extend clean-up to River remediation. Honeywell International is an existing and viable entity with annual revenue of over \$40 Billion
10	Detroit & Lake Superior Copper Company	Copper Smelting	Springwells and the foot of the river (near Fort Wayne)	None		Wastewater from copper smelting contains dissolved and suspended solids that may include concentrations of copper, lead, cadmium, zinc, arsenic, and mercury and has historically been a major source of contamination.	The Detroit smelter would have been a significant contributor of sediments and contaminants of the type identified in Detroit River. However, the Detroit and Lake Superior Copper Company no longer exists. No successor entity has been identified.
11	Detroit White Lead Works	Paint manufacturing	Michigan Ave and US-10 (Lodge Freeway).	None		The site is now occupied by MGM Grand Detroit Casino. The enterprise was established in 1879 and by the late 1800s was using over 1 million pounds of lead annually. Operated at the site for about 30-years.	Likely a significant contributor of the type of contaminants found in river sediments. No successor entity identified.
12	Greenfield Tap and Die Corporation (Kennametal, Inc.)	Tool & Die	2102 West Fort Street	Kennametal		The Detroit factory operated through World War II producing ground thread high speed taps, but the factory no longer exists.	It is unlikely that this operation would have contributed significant quantities of contaminants to existing river sediments. Kennametal, Inc. is an existing and viable enterprise with annual sales of over \$2 Billion.
13	United Drill and Tool Corporation		2108 West Fort Street	None		Typical of dozens of similar tool & die factories operating during the early thru mid-1900s and then disappear shortly after WWII.	It is unlikely that this operation would have contributed significant quantities of contaminants to existing river sediments. No successor entity identified.
14	Detroit Harvester Company	Tractor PTO Implements, Engines, Automotive Parts	5440 West Jefferson Avenue	None		Acquired by Collins & Aikman Corporation (an automotive component manufacturer). The Company's operations spanned 15 countries, incorporating about 120 facilities and approximately 25,000 employees. It entered Chapter 11 bankruptcy in 2005 and went out of business in 2007.	Likely a significant contributor of the type of contaminants found in river sediments. No successor entity identified.

Continued...

Map Key	Identified PRP	PRP Operation	PRP Address	Successor Entity	Address	Comments	Assessment
15	Kelsey-Hayes Wheel Company (ZF Friedrichshafen AG)	Wheel and Brake Manufacturer	3600 Military Street and at the intersection McGraw and Livernois Road.	ZF Friedrichshafen AG		These locations are about 2 to 2 ½ miles inland from the Detroit River, but are immediately adjacent to the Livernois Relief sewer that carries waste water directly to the river down Livernois Road.	Likely a significant contributor of the type of contaminants found in river sediments. In 2017, ZF achieved sales of over \$41Billion and as such, is one of the largest automotive suppliers worldwide.
16	Michigan Malleable Iron Company	Grey Iron Foundry	Between Crossley and Anderson Streets	None		Operated for over 60-years discharging directly into the Detroit River.	Likely a significant contributor of the type of contaminants found in river sediments. No successor entity identified.
17	Great Lakes Works (US Steel)	Primary Steel Manufacturing	Zug Island	US Steel		1963 study ...total solids discharges to the Detroit River via two outfalls of more than 19 tons per day, iron at about 1 ton per day, and oil of over 375 gallons.	Likely a significant contributor of the type of contaminants found in river sediments. US Steel is an existing and viable enterprise with annual revenues of over 12 Billion
18	Fruehauf Trailer Company (Wabash National)	Tractor Trailer Manufacturer	138 South Junction Street	Wabash National		Detroit company started in 1918, became largest in world with factories globally. Bankruptcy and broken-up in 1986, Wabash bought trailer segment...Riverbend plant came and went sometime in between...	Wabash National Corporation is now the largest semi-trailer manufacturer in the country is existing and viable with annual revenue of close to \$2 Billion.
19	Letts Industries (Letts Drop Forge, Detroit Socket Company)	Drop Forge	2714 West Jefferson Avenue			Aerial photos indicate that demolition of the factory began around 2000 and was completely gone before 2016 (it's a cleared lot today). The property has been listed as an inactive Superfund Site requiring remediation.	Likely a significant contributor of the type of contaminants found in river sediments. Letts Industries is an existing and viable privately held company.
20	Fisher Body Plant #18	Automobile Bodies	261 West End Ave.	GM & Conta21iner Port Group		The factory operated for close to 70-years manufacturing planes, parts, tools and automobile bodies. GM went through Chapter 11 bankruptcy in 2007 and reorganized in 2010 leaving legacy liability behind.	Likely a significant contributor of the type of contaminants found in river sediments. GM is currently an existing and viable entity with annual revenue of \$145 Billion
21	Timken Detroit Axle Company	Drop Forge	Clark Street just south of West Fort Street	Meritor		The site is currently an open field. However, the more than 50-year history of manufacturing at the Clark Street factory would have resulted in sewer discharges of oily, heavy metal containing waste water that could have significantly contributed to the types and quantities of sediments identified in the Detroit River.	Likely a significant contributor of the type of contaminants found in river sediments. Rockwell International spun-off the automobile business in 1997 that became Meritor, Inc., a fortune 500 company with annual revenue of over \$3 Billion.
22	Carter Industrials, Inc.	Metal Scrap & Salvage Yard	4690 Humboldt Street	None		Remediated Superfund site. PCB, cadmium, lead, and arsenic. 1.25-miles of 18 th Street combined sewer contaminated and cleaned. Scaling off of Google Maps indicates the site is approximately 2.5-miles inland.	It is unlikely that this operation would have contributed significant quantities of contaminants to existing river sediments. No viable successor entities have been identified.

6.0 Conclusions

There remains only a single active entity in the Riverbend Site with the potential of contributing significantly to the quantities or types of contaminants identified in Detroit River sediments; US Steel on Zug Island. Current digital environmental records reveal a few small industrial activities, but none with serious potential to contribute significantly to river sediments. Review of available records indicates that contaminated sediments must be attributed to legacy activities in the Riverbend Site.

Records indicate a dense concentration of heavy industry existed in the Riverbend Area from roughly the mid-1800s through the mid-1900s. Most were relatively short lived, lasting only as long as the founder and driving force behind the enterprise was around (20-40 years) while a few had longevity and lasted for several generations (in the range of 100-years). The Riverbend Area is and was what would be referred to as a mixed use community with residential, commercial and industrial activities all collocated relatively haphazardly. However, the river edge (from Jefferson Avenue to the water) is almost exclusively industrial (with the exception of a couple parks). The records indicate single family houses, apartment buildings, hotels, bars, butcher shops, retail stores, churches, recreational facilities, warehouses, stables, automobile repair shops, train stations and rail yards, docks and wharfs on the residential and commercial side. Industrial activities started with saw mills, lumber yards, ship and boat building, furniture, wagon and carriage manufacturing, and quickly moved to metal and chemical processing, manufacturing, and power generation. What might be called heavy industry really started in the Riverbend Area around the period of the Civil War (1860s) and ended within 10 to 20 years following World War II (1950s and 60s).

It is the heavy industry that is the focus of identifying potential contributors of contaminated sediments found in the Detroit River. Importantly, sewer installation really began in earnest around 1860 with the rapid growth of Detroit in general and the Riverbend Area specifically. Sewers were designed as self-cleaning (the water flow would keep sediments suspended until discharge) and installed to convey sanitary, industrial and storm water by the most direct route to the Detroit River. There was no treatment until the 1940s. The abiding belief was that dispersion of contaminants in the river would provide decrease and contaminant control.

Like those in other, older U.S. cities, Detroit's first sewers carried a combined wastewater flow consisting of storm water and sanitary waste. Sewers were intended to remove wastewater, not treat it. Wastewater was simply piped to the nearest receiving body of water— either the Detroit or Rouge River— where it was thought the water was capable of purifying and rejuvenating itself. In other words, "dilution is the solution."

This discredited belief still held some sway in the early years of the 20th century. Dr. Giuseppe Cao of the Reale Society Italiana d'Igien in Milan, Italy was quoted in a story that appeared in the December 7, 1904 Detroit News:

"...The water of lakes and rivers, even though infected with immense quantities of refuse materials, is purified spontaneously and after a certain time is freed from all infection and returns to its pristine condition..."¹⁴

Large quantities of industrial waste water were discharged (daily and continuously) directly to the Detroit River during the approximately 100-year period. Eventually, the Detroit River Interceptor (DRI) sewer was installed along Jefferson Avenue to intercept direct river discharges from around Connors' Creek down to the Rouge River (Delray), which was completed in 1937. The DRI was not immediately active and connections were phased-in over many years. River discharges continue to exist in the Riverbend Site as Combined Sewer Overflows (CSO) to accommodate incidental high storm water flows. However, because of categorical pretreatment standards that apply to most industrial dischargers since the 1970s, it is unlikely that the periodic CSO discharges are contributing significant quantities of the types of contaminants identified in the river sediments.

It is entirely plausible that industrial discharges from a hundred years or more ago have resulted in sediments present at the foot of the Detroit River today. The relatively high velocity river flow has scoured the mid-channel areas and swept sediments to the banks where it has remained undisturbed by dredging and other shoreline activities. Mathematical models (computer models) developed in the mid-1900s to predict contaminant transport in riverine settings have been largely ineffective at describing Detroit River sediment transport. This is believed to be attributed to the models reliance on contaminants affixing to colloidal particles in the water column while contaminants in the Detroit River are generally large, heavy particles that settle out of the water column quickly without attaching to colloidal particles and do not transport far downstream. Riverbend industrial discharges included heavy metals, 'sand', grit, tar, oils, coal, and process vessel bottoms.

Potential sources of the types of contaminants found in the Detroit River sediments have been identified based on the volume of discharge and nature of operations at industrial facilities that existed in the Riverbend Area. Seventeen (17) primary sources of contaminants that are likely to have contributed significantly to river sediments have been identified and of these only one (1) remains an active source facility; US Steel. The remaining sixteen (16) primary sources identified are no longer active in the Riverbend Area and of these no records have been recovered indicating viable successors for six (6) entities. An additional three (3) entities have records indicating successors with relatively 'weak' linkage to facilities in the Riverbend Area that no longer exist. The remaining seven (7) entities include; Detroit Edison Delray Power Plant (DTE), Detroit City Gas Company (DTE), Mistersky Power Plant (DTE), Solvay Processes (Honeywell), Letts Drop Forge (Letts Industries), Fisher Body Plant (GM), and Timken Detroit Axle Plant (Meritor). There were a lot of other industrial dischargers that have contributed to existing river sediments. Each of these other entities, taken individually may not represent a significant contributor of contaminants (by volume), but collectively they are significant. The many casting, machining, tool, engine, railcar, wheel, automobile body, boat, ship, parts, and bits manufacturing enterprises all discharged waste water containing contaminants like those identified in existing river sediments.

Many (most) of the 'smaller' contributing source entities have simply 'disappeared' with no identifiable successor organization. Some were merged, acquired or subsumed by other companies and continue on in part or whole elsewhere out of the Riverbend Area (i.e. Anaconda Brass, Kelsey Hayes, Freuhauf) . A few relocated outside the Riverbend Area and continue operations today (i.e. Honeywell, GM, Letts, Meritor).

A particularly noteworthy observation of records relates to the Revere Copper & Brass Company. Once a Fortune 500 company, Revere Copper & Brass went through bankruptcy and was broken-up and sold. A portion was retained by an employee owned buy-out of a factory in New York and a portion was acquired by an oversea interest to utilize the brand name Revere Cookware (manufacturing performed in China and South Korea). However, during and following World War II (1943 thru 1954) the Revere plant in Detroit processed uranium rods for atom bomb production. This was at the beginning of the ‘atomic age’ and appropriate precautionary handling of radioactive materials was just being developed. Records indicate that radioactive dust was ventilated from the buildings for worker safety and grindings were brushed and rinsed from machined rods with water. It is likely, perhaps probable, that these radioactive particles were discharge into the Detroit River both directly and indirectly (rain water washing particles deposited on the roof and surrounding surfaces by the ventilation exhaust). Investigation of the Revere plant for possible residual radiation was not even performed until 1984 and appears cursory, at best.

DuPont was the prime contractor to the US Government for the Manhattan Project (World War II atomic bomb project) and directed Revere processes and practices at the plant. Records indicate the plant processed 2,695,205 pounds of radioactive material. A separate and unrelated study of Revere plant processes in the early 1960s indicated that about 1 ½ tons of suspended solids was discharged into the Detroit River daily. This suggests that there could have been a significant amount of radioactive waste discharged to the Detroit River.

There are many more manufacturing entities that existed through the years in the Riverbend Area than have been captured in this report. A representative cross section of the types of activities that existed has been presented. The potential significant contributors of the types of contaminants found in Detroit River sediments have been identified.

7.0 Recommendations

The eight (8) entities that have been identified as likely significant contributors of the types of contaminants found in Detroit River sediments should be contacted as priority Potential Remediation Partners. The Great Lakes Works (US Steel), Detroit Edison Delray Power Plant (DTE), Detroit City Gas Company (DTE), Mistersky Power Plant (DTE), Solvay Processes (Honeywell), Letts Drop Forge (Letts Industries), Fisher Body Plant (GM), and Timken Detroit Axle Plant (Meritor) are all existing and viable successor organizations to the industrial activities currently or formerly operating in the Riverbend Area.

It is also recommended that DuPont be solicited for participation in remediation actions based on their direct involvement in processing activities at Revere Copper & Brass Company facility. Further, it would appear prudent to perform some limited sediment investigations downstream of the Revere plant to ascertain the presence or absence of radioactive wastes (perhaps previously collected core samples have been retained and can be evaluated with a radmeter).

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Registry ID: 110001848788

Environmental Interest/Information System

AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Historical Generators:

Date form received by agency: 02/13/2008
Site name: HONEYWELL INC
Classification: Not a generator, verified

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This

GREAT LAKES STEEL MICHIGAN STE (Continued)

1004533346

information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Historical Generators:

Date form received by agency: 10/16/1986
Site name: LANG HAROLD SERVICE INC
Classification: Not a generator, verified

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Property Description: The property was most recently used as an A&W Restaurant. Prior to Phase I ESA, available information indicated that the property may have been formerly used as a gasoling service station. Phase I ESA identified that the property was predominantly vacant until 1959, when the restaurant was constructed. The Phase I ESA did not identify any information that indicated that the property was formerly a gasoline service station. No recognized environmental conditions (RECs) identified.

FINDS:

Registry ID: 110003681007

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

. Waste code: D001

. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Summary Details:

The Lower Ecorse Creek Dump site is located in Wyandotte, Wayne County, Michigan. The site consists of the residence at 470 North Drive and three neighboring parcels of land. The site occupies a level area with the back of the lots abutting the Ecorse River. During the period between 1945 and 1955, and prior to the house at 470 North Drive being built, the low lying swampy area of the creek was filled with material from local industries. Some of the fill material contained what has been confirmed as ferric ferrocyanide, commonly referred to as Prussian Blue. The blue soil was also found across the street at 471 North Drive, approximately two feet below the surface and the owner of the residence at 469 North Drive also reported that he found the blue soil in his yard. In addition, there are two vacant lots east of 470 North Drive where Prussian Blue is exposed. Neighborhood

children have used portions of these lots as a go-cart track and wearing of the topsoil by the go-carts has exposed the Prussian Blue. The EPA was contacted by the Wayne County Health Department on October 25, 1989. EPA tasked its Technical Assistance Team (TAT) on October 27, 1989, to conduct a site investigation and sampling. Sampling results were provided to ATSDR for review and assessment. ATSDR's review on November 22, 1989, concluded that the levels of cyanide found in the soil do present an urgent public health threat. Steps to eliminate any direct contact with the contaminated soil need to be taken immediately. Following ATSDR's determination that the presence of cyanide-contaminated wastes in an unrestricted residential area presented an immediate and significant public health threat, EPA's Emergency Response Branch initiated removal activities. On December 4, 1989, work commenced to cover the contaminated areas with six inches of clean topsoil and fill in areas of the driveway and sidewalk which had been previously excavated by the property owner. This action eliminated physical contact with Prussian Blue and related cyanide compounds which had spread throughout the area. The initial action was completed in the summer of 1990 with the establishment of a vegetative cover. The Final ATSDR Health Advisory which was released on August 13, 1993, recommended the following actions: 1) immediately dissociate the affected residents from cyanide contamination, which is at levels of health concern in residential subsurface soils; 2) implement permanent measures to remediate the contamination as appropriate; and 3) consider including the Lower Ecorse Creek Dump site on the EPA National Priorities List or, using other statutory or regulatory authorities as appropriate, take other steps to characterize the site and take necessary action. Such activities are better addressed under remedial authorities than removal considering the costs and time involved in an extensive groundwater study and potential groundwater remediation. Additional recommendations by ATSDR include conducting a door-to-door well survey and well sampling to determine the extent and level of any groundwater contamination. ATSDR also suggests restricting digging into contaminated subsurface soil to prevent human contact with contaminated soils and released cyanide gas. The description of the site (release) is based on information available at the time the ATSDR Health Advisory was issued. The description may change as additional information is gathered on the sources and extent of contamination. See 56 FR 5600, February 11, 1991, or subsequent FR notices.

Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001

. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Historical Generators:

Date form received by agency: 11/21/1993

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

FINDS:

Registry ID: 110009595820

Environmental Interest/Information System
TSCA SUBMITTER

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

 User oil refiner: No
 Used oil fuel marketer to burner: No
 Used oil Specification marketer: No
 Used oil transfer facility: No
 Used oil transporter: No

. Waste code: D001

. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001

. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Historical Generators:

Date form received by agency: 08/11/1994
Site name: MIKES B P STATION
Classification: Small Quantity Generator

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Property Description:	The northwestern portion of the subject property was improved with approximately five dwellings and one detached garage prior to 1924. Prior to 1950, one dwelling was razed and four dwellings and two detached garages were constructed. Prior to 1957, the dwellings were razed. A municipal incinerator was constructed on the eastern portion of the parcel in approximately 1957. The incinerator was razed in approximately 2004. The southern portion of the subject property was used for storage beginning in 1949 apparently by the former steel mill on the southeastern adjoining property. In 2000, apparent semi-trailers were parked on the western portion of the subject property. Currently, the subject property is unimproved, vegetative covered land with several soil mounds and debris piles and a metal light tower. Previous occupants of the subject property identified during this assessment include City of Ecorse Municipal Incinerator, Michigan Steel, Great Lakes Steel Corporation, and United Steel Corporation.

Property Description:	The subject property was historically owned by National Steel. Ashland Oil reportedly leased the subject property from National Steel from the late 1920s until 1965. Ashland Oil developed the subject property with a bulk oil tank farm prior to 1937. After 1965, National Steel reportedly leased the subject property to various companies. The subject property was reportedly unused from 1999 until early 2004, when UOC purchased the subject property for use as a used oil storage/transfer facility. The subject property is currently unused.

 Property Description:

The subject property was historically owned by National Steel. Ashland Oil reportedly leased the subject property from National Steel from the late 1920s until 1965. Ashland Oil developed the subject property with a bulk oil tank farm prior to 1937. After 1965, National Steel reportedly leased the subject property to various companies. The subject property was reportedly unused from 1999 until early 2004, when UOC purchased the subject property for use as a used oil storage/transfer facility. The subject property is currently unused.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002

. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

CRITERIA AIR POLLUTANT MAJOR

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United

States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

AIR MAJOR

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

US EPA Risk Management Plan (RMP) database stores the risk management plans reported by companies that handle, manufacture, use, or store certain flammable or toxic substances, as required under section 112(r) of the Clean Air Act (CAA).

Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Historical Generators:

FINDS:

Registry ID: 110003717764

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001

. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Historical Generators:

Date form received by agency: 05/20/2003
Site name: NATIONAL STEEL CORP
Classification: Not a generator, verified

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Historical Generators:

Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Classification: Small Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001

. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Property Description:	

The former McCord Site is reported to have consisted of vacant land and residential homes prior to construction of the first industrial building around 1917. Multiple additions and modifications were made to the building between 1920 and 1985. The office building attached to the east side of the manufacturing building was a renovated former house moved to the site in 1941. The last major addition to the building was the construction in 1974 of additional warehouse and manufacturing areas on the south side of the building. A smaller addition was constructed on the northeast corner of the building in 1985. The building was originally occupied by All Metal Products Company, a manufacturer of metal toy guns, air rifles, cars, trucks and airplanes. All Metal Products operated at the site from 1917 until 1951. At that time the site was sold to McCord Corporation, a gasket manufacturer. McCord Corporation acquired additional adjacent property and manufactured gaskets on the site until the early 1990s. Starr Tech, an automotive parts rack manufacturer, occupied the southern portion of the building in the late 1990s. Otherwise, the site appears to have been used for a variety of storage operations since McCord ceased site operations.

building around 1917. Multiple additions and modifications were made to the building between 1920 and 1985. The office building attached to the east side of the manufacturing building was a renovated former house moved to the site in 1941. The last major addition to the building was the construction in 1974 of additional warehouse and manufacturing areas on the south side of the building. A smaller addition was constructed on the northeast corner of the building in 1985. The building was originally occupied by All Metal Products Company, a manufacturer of metal toy guns, air rifles, cars, trucks and airplanes. All Metal Products operated at the site from 1917 until 1951. At that time the site was sold to McCord Corporation, a gasket manufacturer. McCord Corporation acquired additional adjacent property and manufactured gaskets on the site until the early 1990s. Starr Tech, an automotive parts rack manufacturer, occupied the southern portion of the building in the late 1990s. Otherwise, the site appears to have been used for a variety of storage operations since McCord ceased site operations.

Property Description:	The former McCord Site is reported to have consisted of vacant land and residential homes prior to construction of the first industrial building around 1917. Multiple additions and modifications were made to the building between 1920 and 1985. The office building attached to the east side of the manufacturing building was a renovated former house moved to the site in 1941. The last major addition to the building was the construction in 1974 of additional warehouse and manufacturing areas on the south side of the building. A smaller addition was constructed on the northeast corner of the building in

1985. The building was originally occupied by All Metal Products Company, a manufacturer of metal toy guns, air rifles, cars, trucks and airplanes. All Metal Products operated at the site from 1917 until 1951. At that time the site was sold to McCord Corporation, a gasket manufacturer. McCord Corporation acquired additional adjacent property and manufactured gaskets on the site until the early 1990s. Starr Tech, an automotive parts rack manufacturer, occupied the southern portion of the building in the late 1990s. Otherwise, the site appears to have been used for a variety of storage operations since McCord ceased site operations.

FINDS:

Registry ID: 110038699968

Environmental Interest/Information System

US EPA Assessment, Cleanup and Redevelopment Exchange System (ACRES) is an federal online database for Brownfields Grantees to electronically submit data directly to EPA.

Registry ID: 110002117664

Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001

. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

- . Waste code: D001
- . Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Corrective Action Summary:

Event date: 04/06/1988
Event: DETERMINATION OF NEED FOR AN INVESTIGATION-INVESTIGATION IS NOT NECESSARY

Event date: 04/06/1988
Event: RFA COMPLETED

Event date: 09/27/1991
Event: CA PRIORITIZATION-LOW CA PRIORITY

Event date: 11/04/1999
Event: RELEASE TO GW CONTROLLED DETERMINATION-YES, APPLICABLE AS OF THIS DATE

Event date: 11/04/1999
Event: HUMAN EXPOSURES CONTROLLED DETERMINATION-YES, APPLICABLE AS OF THIS DATE

Event date: 07/20/2001
Event: FEDERAL PERMIT LEAD SITE

Event date: 10/16/2014
Event: MISC. WORKPLAN SUBMITTED

Property Description:	The property consisted of unimproved land that was used as a lumber storage yard from at least 1897 until approximately the mid to late 1930s. At that time, the property remained vacant land that was not being used for a significant or obvious purpose. In approximately 1952, the property was improved with a light industrial building and associated paved and landscaped areas. The City of River Rouge Department of Public Works has been the only identified occupant of the subject building since its construction.

Property Description:	The property consisted of unimproved land that was used as a lumber storage yard from at least 1897 until approximately the mid to late 1930s. At that time, the property remained vacant land that was not being used for a significant or obvious purpose. In approximately 1952, the property was improved with a light industrial building and associated paved and landscaped areas. The City of River Rouge Department of Public Works has been the only identified occupant of the subject building since its construction.

Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 05/13/2018	Source: EPA

	Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 05/13/2018	Source: EPA
Date Data Arrived at EDR: 05/30/2018	Telephone: N/A

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 01/05/2017	Telephone: 703-603-8704
Date Made Active in Reports: 04/07/2017	Last EDR Contact: 07/06/2018
Number of Days to Update: 92	Next Scheduled EDR Contact: 10/15/2018
	Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 05/18/2018	Source: EPA
Date Data Arrived at EDR: 05/30/2018	Telephone: 800-424-9346
Date Made Active in Reports: 06/22/2018	Last EDR Contact: 07/06/2018
Number of Days to Update: 23	Next Scheduled EDR Contact: 10/15/2018
	Data Release Frequency: Quarterly

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Date of Government Version: 05/18/2018	Source: EPA

CORRACTS: Corrective Action Report

CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 03/01/2018	Source: EPA
Date Data Arrived at EDR: 03/28/2018	Telephone: 800-424-9346
Date Made Active in Reports: 06/22/2018	Last EDR Contact: 06/28/2018
Number of Days to Update: 86	Next Scheduled EDR Contact: 10/08/2018
	Data Release Frequency: Quarterly

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 03/01/2018	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/28/2018	Telephone: 312-886-6186
Date Made Active in Reports: 06/22/2018	Last EDR Contact: 06/28/2018
Number of Days to Update: 86	Next Scheduled EDR Contact: 10/08/2018
	Data Release Frequency: Quarterly

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 03/01/2018	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/28/2018	Telephone: 312-886-6186

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

MI INVENTORY: Inventory of Facilities

The Inventory of Facilities has three data sources: Facilities under Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA) identified through state funded or private party response activities (Projects); Facilities under Part 213, Leaking Underground Storage Tanks of the NREPA; and Facilities identified through submittals of Baseline Environmental Assessments (BEA) submitted pursuant to Part 201 or Part 213 of the NREPA. The Part 201 Projects Inventory does not include all of the facilities that are subject to regulation under Part 201 because owners are not required to inform the Department of Environmental Quality (DEQ) about the facilities and can pursue cleanup independently. Facilities that are not known to DEQ are not on the Inventory, nor are locations with releases that resulted in low environmental impact. Part 213 facilities listed here may have more than one release; a list of releases for which corrective actions have been completed and list of releases for which corrective action has not been completed is located on the Leaking Underground Storage Tanks Site Search webpage. The DEQ may or may not have reviewed and concurred with the conclusion that the corrective actions described in a closure report meets criteria. A BEA is a document that new or prospective property owners/operations disclose to the DEQ identifying the property as a facility pursuant to Part 201 and Part 213. The Inventory of BEA Facilities overlaps in part with the Part 201 Projects facilities and Part 213 facilities. There may be more than one BEA for each facility.

MI PART 201: Part 201 Site List

A Part 201 Listed site is a location that has been evaluated and scored by the DEQ using the Part 201 scoring model. The location is or includes a "facility" as defined by Part 201, where there has been a release of a hazardous substance(s) in excess of the Part 201 residential criteria, and/or where corrective actions have not been completed under Part 201 to meet the applicable cleanup criteria for unrestricted residential use. The Part 201 List does not include all of the sites of contamination that are subject to regulation under Part 201 because owners are not required to inform the DEQ about the sites and can pursue cleanup independently. Sites of environmental contamination that are not known to DEQ are not on the list, nor are sites with releases that resulted in low environmental impact.

MI DEL PART 201: Delisted List of Contaminated Sites

A deleted site has been removed from the Part 201 List because information known to the DEQ at the time of the evaluation does not support inclusion on the Part 201 List. This designation is often applied to sites where changes in cleanup criteria resulted in a determination that the site no longer exceeds any applicable cleanup criterion.

A delisted site has been removed from the Part 201 List because response actions have reduced the levels of contaminants to concentrations which meet or are below the criteria for unrestricted residential use.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Local Land Records

MI LIENS: Lien List

An Environmental Lien is a charge, security, or encumbrance upon title to a property to secure the payment of a cost, damage, debt, obligation, or duty arising out of response actions, cleanup, or other remediation of hazardous substances or petroleum products upon a property, including (but not limited to) liens imposed pursuant to CERCLA 42 USC * 9607(1) and similar state or local laws. In other words: a lien placed upon a property's title due to an environmental condition

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

Contact: Dennis Karl

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Environmental Compliance Office Inc. were identified for the years listed below (selected maps only*). The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Limited Permission To Make Copies

Environmental Compliance Office Inc. (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.
