

Action in Minnesota to Address PAH-Contaminated Stormwater Pond Sediments by Restricting Usage of Coal Tar-Based Sealants

Judy L. Crane, Ph.D.

Environmental Analysis and Outcomes Division
Minnesota Pollution Control Agency (MPCA)
St. Paul, MN

EPA's Stormwater Pollution Prevention Webinar
June 14, 2012

Overview

- Why are we concerned about polycyclic aromatic hydrocarbons (PAHs) in stormwater pond sediments?
- How are the Minnesota Legislature, Minnesota Pollution Control Agency (MPCA), and municipalities addressing this issue?
- What are the most likely sources of PAHs to stormwater pond sediments in Minnesota?
- What actions have been taken to reduce usage of coal tar-based sealants in Minnesota?

LeVander Pond (SWP09 02)
in South St. Paul, MN

Problem: Stormwater ponds in the Twin Cities are filling up with sediment, some of which are highly contaminated with PAHs.

Nonfunctioning stormwater ponds in Woodbury, MN

Removal of PAH-Contaminated Sediments Can be Expensive

- Most cities in Minnesota slowed maintenance dredging of their stormwater ponds after White Bear Lake, MN received cost estimates of \$250,000 to clean out two stormwater ponds in 2007;
- Cities are hampered by limited reuse options and disposal cost issues; and
- Cities have requested a solution from the Minnesota Legislature and MPCA.

What are the Costs for Disposal?

- In Minnesota, the most contaminated Level 3 dredged material must be disposed of in specially lined landfills or other approved options.
- Disposal costs vary with landfill.

Cost/cubic yard	Buffalo \$12.00	Elk River \$10.50	Rosemount \$22.50
------------------------	----------------------------------	------------------------------------	------------------------------------

Wetland delineation and/or surveying costs not included.

Total cost = \$40 to \$50/cubic yard

(Testing + Mobilization/overhead + Excavation + Transportation + Disposal)

Tipping fees to dispose of sediment as waste instead of cover material is even more expensive.

PAH White Paper

Contamination of Stormwater Pond Sediments by Polycyclic Aromatic Hydrocarbons (PAHs) in Minnesota

The Role of Coal Tar-based Sealcoat Products as a Source of PAHs

Minnesota Pollution Control Agency

March 2010

Asphalt-based Sealants are a Suitable Alternative to Coal Tar-based Sealants

Ace Hardware, Agway, Do It Best, Lowe's, Menards, The Home Depot, True Value, and United Hardware no longer sell coal tar-based sealants.

Legislative Response to Issue

- The Minnesota Legislature provided the MPCA with funding to study this issue on July 1, 2009.
- The legislation directed the MPCA to conduct several tasks as detailed at: <http://www.pca.state.mn.us/ktqha7e>.
- The Legislature banned state agencies from purchasing undiluted coal tar-based sealant after July 1, 2010.

Incentive for Municipalities from 2009 Legislation

Local units of government must pass an ordinance prohibiting and/or restricting the use of coal tar-based sealants to be considered for a grant to treat contaminated sediments in their stormwater ponds.

20 Municipalities in Minnesota have Passed Ordinances

The screenshot shows a Google Maps browser window with the title "US Coal Tar Sealant Bans & Government Restrictions - Google Maps - Windows Internet Explorer". The browser address bar shows the URL: <https://maps.google.com/maps/ms?msa=0&msid=211259233898219765587.0004bec3609047daca9f>. The browser's Favorites bar includes "Environmental Science & Te...", "Contaminated Sediments - ...", "Restriction on Coal Tar-Bas...", "Doer", "Finance", "Intranet", "Northstar", and "PCA Web Page". The browser's navigation bar shows "You", "Search", "Images", "Maps", "Play", "YouTube", "News", "Gmail", "Documents", "Calendar", and "More". The Google search bar is empty, and the user's email address "judylcrane.mn@gmail.com" is visible in the top right. The map itself shows a region around Minneapolis, Minnesota, with 20 blue pins indicating municipalities that have passed ordinances. The pins are located in Buffalo, Coon Rapids, Brooklyn Park, New Brighton, White Bear Lake, Minneapolis, Longfellow, Woodbury, Richfield, Bloomington, Eagan, Burnsville, Apple Valley, Shakopee, Minnetonka, Waconia, and Cannon Falls. A legend on the left side of the map indicates: Blue: Outright Ban, Red: Restricted Use, for Public & Private, and Green: Government Restricted Use. The map also includes a scale bar (10 mi / 20 km), a "Satellite" button, and a "Traffic" button. The browser's taskbar at the bottom shows the Start button, several open applications, and the system tray with the time "5:17 PM".

Legislative Funding for Stormwater Pond Sediment Study

- Part of the 2009 legislative funding related to developing best management practices. This included funds for a study of stormwater pond sediments in different land use categories (residential, commercial, and industrial areas) for PAHs and other contaminants of potential concern.
- Another component of this study included evaluating sampling and screening methods for good, cost-effective techniques.

PAH Analyses

- Parent and 24 carcinogenic PAHs (cPAHs) were analyzed on all samples by Pace Analytical Services, Inc.; and
- Parent and alkylated PAHs (p-alkPAHs) were analyzed on composite samples by Battelle.

Results

Two industrial ponds and one commercial pond exceeded the Level II sediment quality target (SQT) value for total PAH₁₃. These three ponds also exceeded ESB toxic units of 1.0, indicating detrimental impacts to bottom-dwelling invertebrates.

Ranges of Human Health-based Benzo[a]Pyrene (B[a]P) Equivalents for Study Ponds*

Calculation Procedure	B[a]P Equivalents (mg/kg)			
	ND	≤2.0 (Level 1 Dredged Mat'l)	>2.0 to ≤3.0 (Level 2 Dredged Mat'l)	>3.0 (Level 3 Dredged Mat'l)
Using MPCA Potency Equivalency Factors**	4	2	0	9

ND = not detected

*Based on the 24 cPAHs analyzed in composite samples by Pace Analytical; field replicate data were excluded; n = 15 ponds.

**Kaplan-Meier statistics were used when ≤50% of samples had nondetect data.

Identifying Sources of PAHs with Environmental Forensic Techniques

Solving Mysteries

Source Apportionment of p-alkPAH Data from Composite Samples

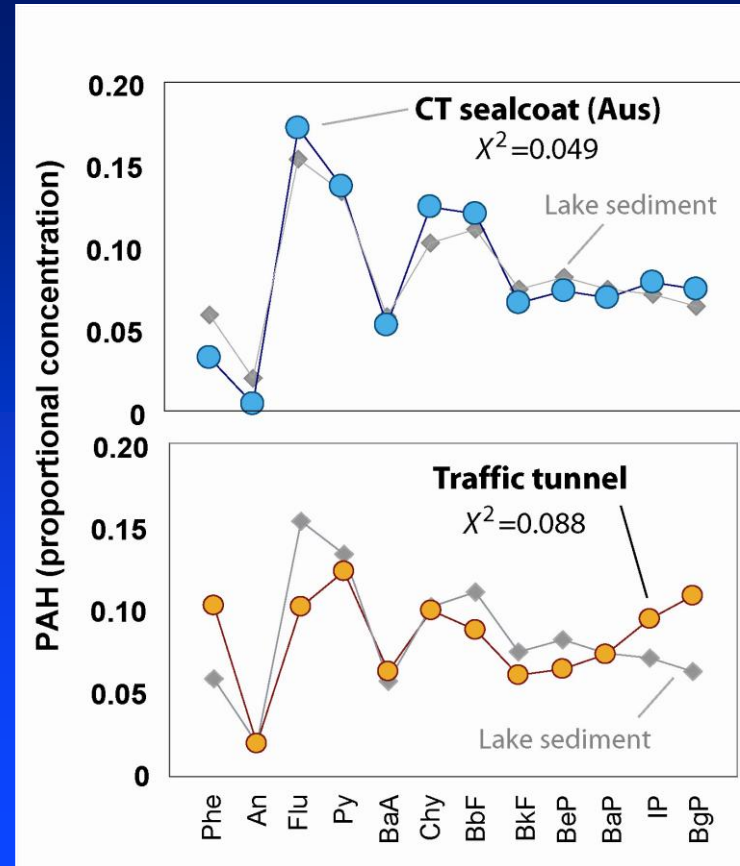

Statistical Summary	% Diagenic (natural) PAHs	% Petrogenic (oil-based) PAHs	% Pyrogenic (combustion) PAHs
Mean	2.4	15.0	82.6
SD	2.7	7.2	9.6
Minimum	1.1	7.4	50.0
Maximum	12.0	38.0	91.3

N = 15 composite samples analyzed by Battelle for 34 p-alkPAHs. Yellow shading denotes results for SWP09-02-C (LeVander Pond).

**Quantitative techniques, like the U.S. EPA's
contaminant mass balance model (CMB)
version 8.2, provide a rigorous method for
apportioning sources of PAHs.**

How does the CMB8.2 Model Work?

- Incorporates published source profiles (fingerprints) for 12 PAHs;
- Figures out the best combination of sources to best match the sediment sample by minimizing Chi-squared; and
- Provides estimated mass loading and uncertainty for each source.

PAHs, low to high molecular weight;
graphic from Peter Van Metre (USGS).

Coal Tar-based Sealants and Traffic Tunnel Air are the Most Prevalent Sources of PAHs in Metro Stormwater Pond Sediments (n = 15)

Summary Statistics	Coal Tar-based Sealant Sum (%)	Traffic Tunnel Air (%)
Mean	70.5	17.8
SD	17.9	12.9

Model includes 12 of the 34 p-alkPAHs measured by Battelle.

Statistical results of model: $R^2 = 0.981$, Chi-squared = 0.213, % Mass = 100.6%; T value >2 for 10 ponds for coal tar sealant scrapings.

Mean relative percent difference between measured and calculated total PAH₁₂ concentrations was 0.87%.

Ran the CMB8.2 Model on the Met Council's Twin Cities Stormwater Pond Sediment Data Set (Polta *et al.* 2006)

- Excluded samples that either didn't meet their data quality objectives or were from a pond that had completely filled in (i.e., were soil samples);
- Used PAH data from 26 of the 50 sediment samples collected from 10 stormwater ponds in the Twin Cities metropolitan area; and
- The depth of individual sediment samples in this study varied from 15.2 – 45.7 cm.

Source Apportionment of Total PAH₁₂ for Acceptable Met Council Data

Summary Statistics*	Coal Tar-based Sealant Sum %	Pine Wood Combust. %	Coal %	Traffic Tunnel Air %	Oil Burner %	Residen. Air %
Weighted Mean	69.4	10.0	7.0	6.0	3.9	2.9
SD	14.7	10.7	11.7	8.6	6.6	4.2

*n = 26 samples

Statistical results of model: $R^2 = 0.970$, Chi-square = 0.422, % Mass = 93.1; T value >2 for 13 samples for coal tar-based sealant sources.

Mean relative percent difference between measured and calculated total PAH₁₂ concentrations was 7.8%.

Coal Tar-based Sealants are the Biggest Source of PAHs to Stormwater Pond and Lake Sediments in the Twin Cities

Study	Mean % Coal Tar-based Sealant Source*
MPCA Study	70.5
Met Council Study	69.4**
Palmer Lake in Brooklyn Center, MN (Van Metre and Mahler 2010)	72.2
Lake Harriet in Minneapolis, MN (Van Metre and Mahler 2010)	51.9

*determined using EPA CMB8.2 model

**results are for a weighted mean

CMB8.2 Model Results Provide a Better Estimate of Pyrogenic (Combustion) Sources of PAHs

- Used the results of the model and the mean percent pyrogenic PAHs (82.6%) calculated from the total PAH₃₄ data set to calculate the percent of total PAHs₃₄ from:
 - Coal tar-based sealant sources = $0.705 \times 82.6\% =$ **58.2%**
 - Traffic tunnel source = $0.178 \times 82.6\% =$ **14.7%**
 - Other model sources = $0.117 \times 82.6\% =$ **9.7%**

MPCA Study: PAH Sources (mean %)

Other Efforts by the MPCA to Reduce Usage of Coal Tar-based Sealants

Great Lakes Restoration Initiative Grant to Promote Phase-out of Coal Tar-based Sealants

- MPCA lead (Al Innes) with Michigan and Wisconsin collaboration;
- Grant duration: 10/1/2011 to 9/30/2014;
- Work tasks:
 - Implement voluntary phase-out of the product in Minnesota in partnership with coatings and asphalt associations (partnerships could not be negotiated),
 - Contact retailers to determine where the product is still sold and promote voluntary phase-outs (in progress),

Other Grant Work Tasks in Progress

- Promote switch in sealant products by applicators (Jet-Black has committed to switch from coal tar-based to asphalt-based sealants in 2012-13 in MN/WI and is promoting in 10 other states),
- Work with other users (cities, property managers, schools/colleges, airports, etc.) to phase out coal tar-based sealants where still in use,
- Work with suppliers/researchers to promote feasible low or no PAH alternatives, and
- **Share strategies and products with other states.**
