Outline

- Basic refrigeration cycle
- Conventional “series” heat reclaim
- Full-condensing “parallel” heat reclaim
 - Direct
 - Hydronic
- Water-cooled condensing heat reclaim
- Results

Conventional “Series” Heat Reclaim

- Captures superheat+ to water or air, when needed
- Controlled by 3-way valve; on/off logic

Conventional “Series” Heat Reclaim

Pros:

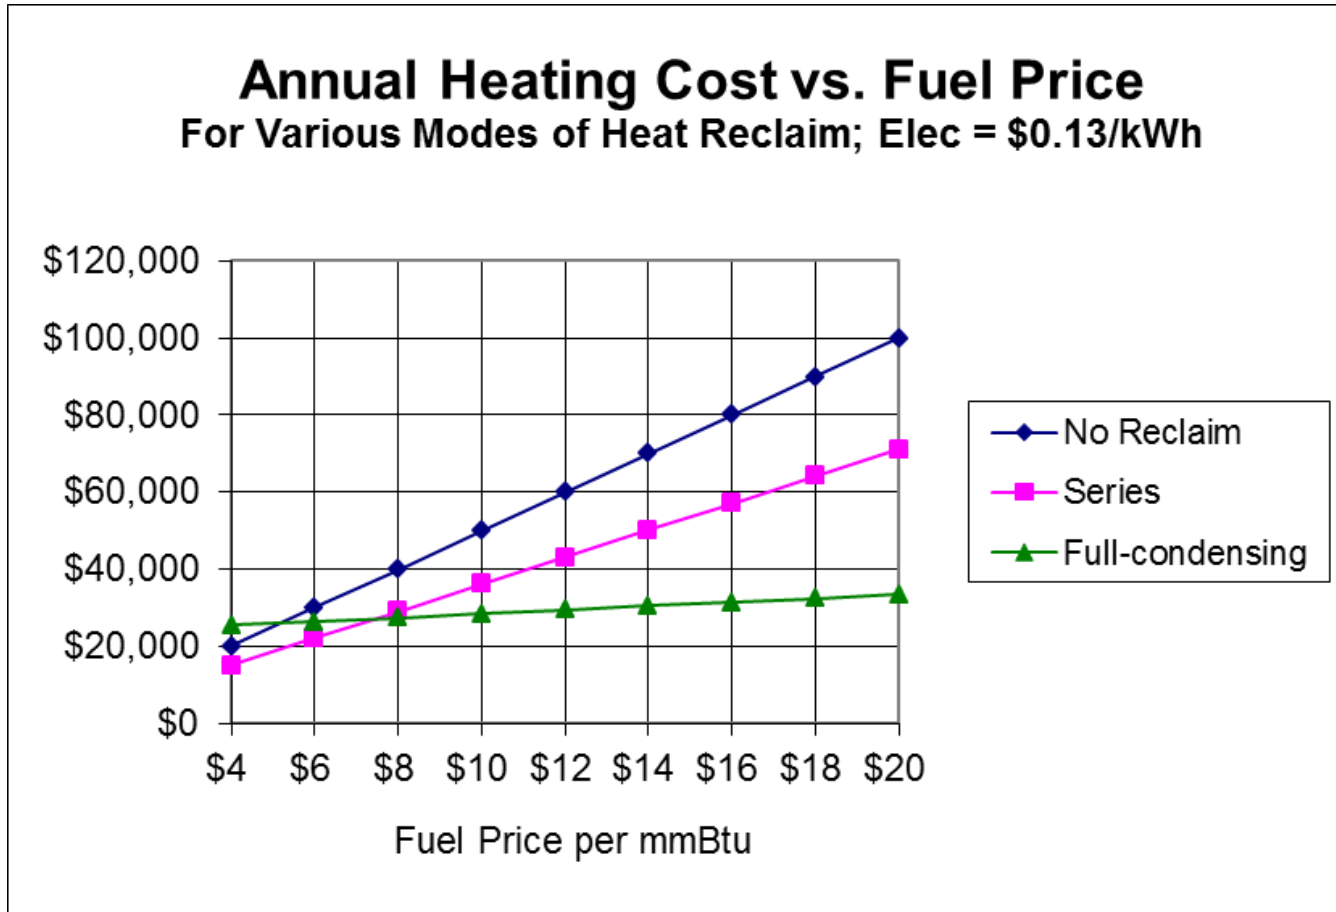

- Captures superheat+
- Controllable (on/off)
- Temperatures can be compatible with water and air heating systems
- “Free” heat
- Traditional

Cons:

- Doesn't capture full latent heat of vap.
- Hard to know how much condensing occurs
- Can interfere with floating head strategy (so is it really “free”?)

Economics

4,000 mmBtu Annual Space Heating Load; Maine Weather

Full-Condensing “Parallel” Heat Reclaim

- Captures full heat of rejection; direct or hydronic
- Controlled by 3-way valve; either/or logic

Full-Condensing “Parallel” Heat Reclaim

Pros:

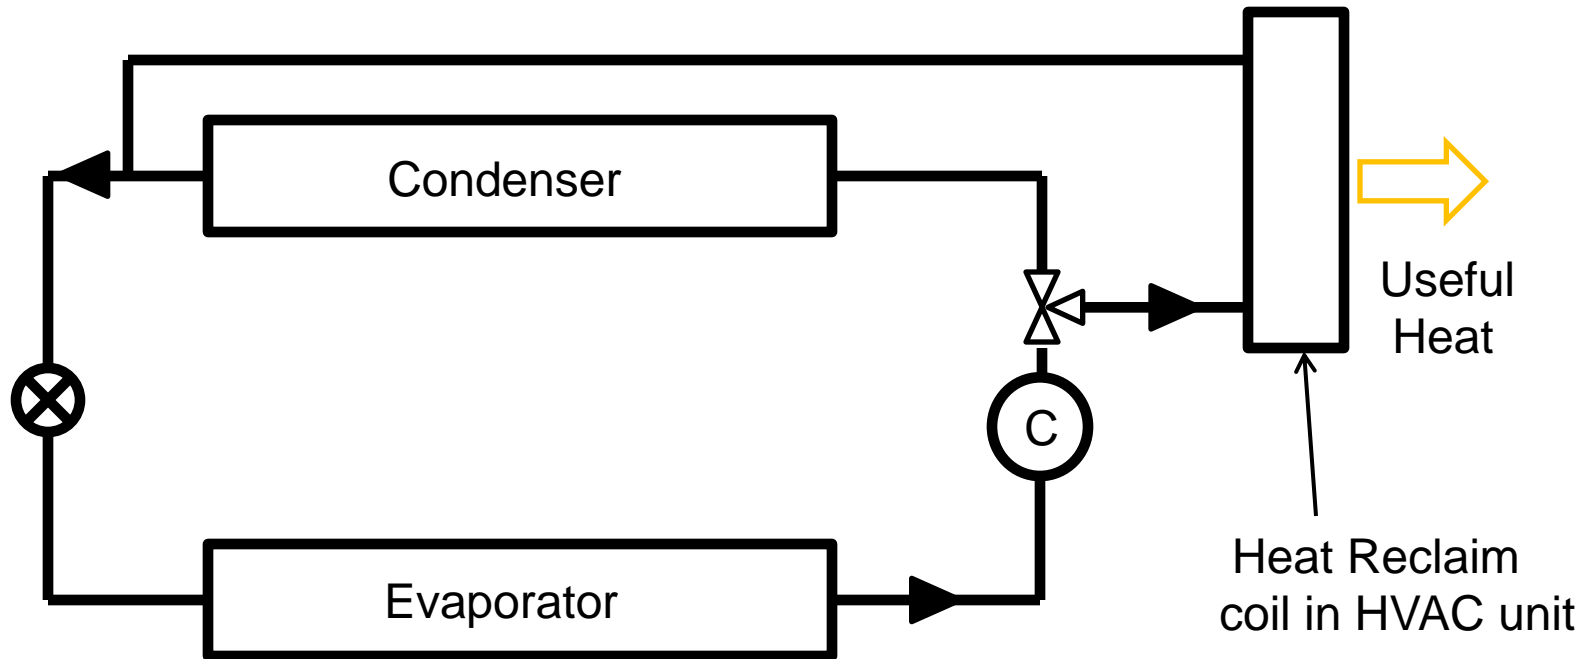

- Captures 100% of heat of rejection
- Controllable (but not like typical HVAC)
- Reclaimed heat can be more economical than purchased fuel
- Flexible; air or glycol

Cons:

- Lower temperatures
 - Too low for water htg
 - Requires more coil area and cfm for space heat
- HVAC coil sizing and zoning can be tricky
- Charge management can be challenging
- Higher up-front cost

Water-Cooled Condensing Heat Reclaim

- Captures full heat of rejection to water /glycol, full-time

Why pursue water-cooled condensing?

- Climate change concerns; need to reduce emissions
 - Reduced charge on high side; 600 vs. 1,000 lbs/rack
 - Stable operation allows for receiver level monitoring
- Easier to pipe reclaimed heat to remote HVAC units (e.g., front lobby/vestibule, back room); can displace more purchased fuel
- Economics work in cold climates; approx. 4 year payback on incremental investment in northern New England

Water Cooled Condensing Heat Reclaim; Similar to Full-Condensing plus...

Pros:

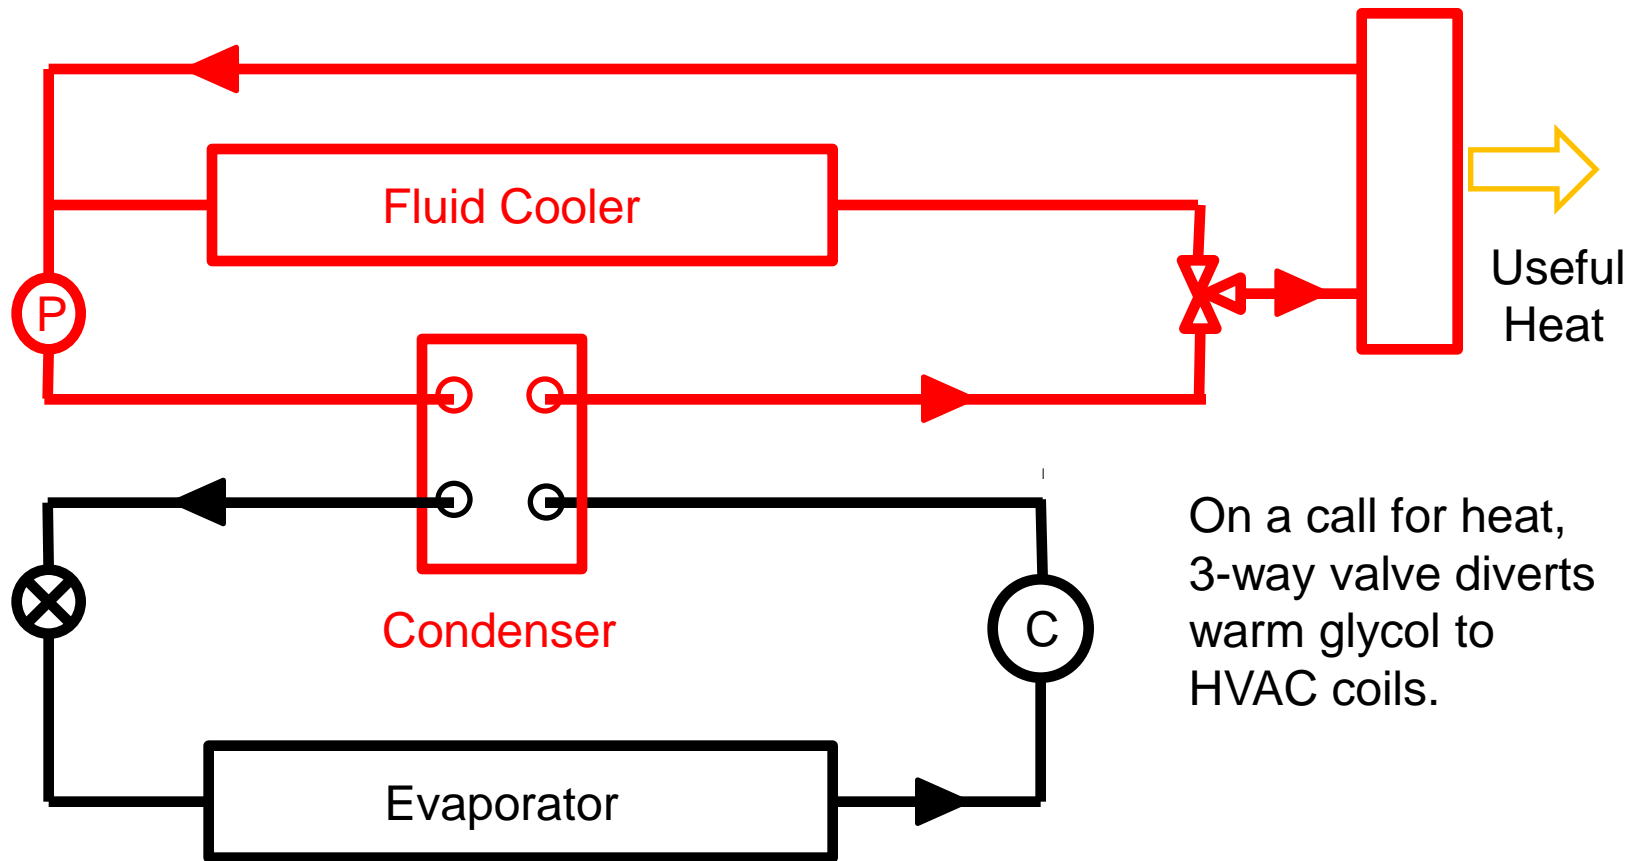

- Reduced charge/leaks and better charge mgt
- Can pipe to all HVAC coils to displace purchased fuel

Cons:

- Higher up-front cost to equip and pipe all racks and HVAC units

Water-Cooled Condensing Options

- 3-way valve to glycol reclaim coils in parallel

Integrating HR with HVAC

- Bigger coils and higher airflow (cfm) due to lower delta-T
- HR supply controlled by 3-way valve at rack
- HR loads can be:
 - Dedicated system per rack (on/off), or
 - Common HR loop (stages)
- HVAC zoning and control is different!

Performance Data

2000: No heat reclaim.

2002: Added full-condensing heat reclaim to “cold aisles”.

2005: Added series HR to dedicated outside air unit.

2009: Water-cooled condensing heat reclaim from all racks (3 or 4) to all HVAC units.
