Glossary of Terms

APPENDIX P

GLOSSARY OF TERMS

1-Year average concentration – The average of all measured detections and substituted zeros for non-detects for a given calendar year. This average is used in the trends analysis section and differs from an annual average because the criterion for the quarterly averages is not required for its calculation.

Accuracy – Indicates the extent to which experimental measurements represent their corresponding “true” or “actual” values. Also referred to as bias.

Acute risk – Risk associated with short-term exposures; acute health effects develop from a single exposure or from exposures over short periods of time (EPA, 2010a).

Air Quality System (AQS) – EPA's online repository of ambient air quality data.

Air Toxics – Pollutants that are known or suspected to have the potential for negative human health effects.

Analytical precision – A measurement of errors associated with the process of analyzing environmental samples.

Annual average concentration – The average of all measured detections and substituted zeros for non-detects for a given calendar year. The calculation of annual averages includes the following criteria: 1) three valid quarterly averages must be available and 2) method completeness must be greater than or equal to 85 percent.

Anthropogenic sources – Sources of emissions that are man-made.

Audit samples – Samples that are prepared by an external source and analyzed by the laboratory, where the respective concentrations of the audit samples are unknown to the laboratory. The laboratory analyzes the samples and the external source compares the measured concentrations to the reference concentrations of those audit samples and calculates a percent difference.

Annual Average Daily Traffic (AADT) – The “annual traffic count divided by the number of days in the year or a short-term traffic count annualized by factors to account for seasonality, etc.” (FHWA, 2015).

Blank – A sample subjected to the usual analytical or measurement process to establish a zero baseline or background value. Blank samples are intended to contain none of the analytes of interest. Measurements from blanks are sometimes used to adjust or correct routine analytical results. A blank is used to detect contamination during sample handling, preparation and/or analysis.

Cancer risk – The likelihood of developing cancer as a result of exposure over a 70-year period, and is presented as the number of people at risk for cancer per million people.

Cancer risk approximation – An estimate of the cancer risk due to exposure at the annual average concentration over a 70-year period (and not the risk resulting from exposure over the time period covered in this report).

Central tendency statistics – Calculations to determine the central tendency, or value representing the “middle” of the data set, and includes the calculations of arithmetic mean (average) and median.

Chain of custody – An unbroken trail of accountability that ensures the physical security of samples, data, and records.

Chronic risk – Risk associated with long-term exposures; chronic effects develop from repeated exposure over long periods of time (EPA, 2010a).

Coefficient of variation – Provides a relative measure of variability by expressing standard deviation to the magnitude of the arithmetic mean.

Collocated samples – Samples collected simultaneously through separate inlet probes, regardless of sampler set-up (i.e., either two separate sampling systems or a single sampling system with multiple inlets). See also *duplicate sample*.

Completeness – Refers to the number of valid samples successfully collected and analyzed compared to the number of total samples expected based on a 1-in-6 or 1-in-12 day sample schedule.

Confidence interval – The interval within which the true average concentration falls 95 percent of the time. The confidence interval includes an equal amount of quantities above and below the concentration average.

Core Based Statistical Area (CBSA) – Refers to either a metropolitan or micropolitan statistical area.

Data distribution statistics – Calculations that show how data are distributed in a given dataset and includes the first and third quartiles (25th and 75th percentiles) and the median (50th percentile).

Data Quality Objectives (DQOs) – The qualitative and quantitative statements derived from the DQO Process that clarify a study’s technical and quality objectives, define the appropriate type of data, and specify tolerable levels of potential decision errors that will be used as the basis for establishing the quality and quantity of data needed to support decisions.

Data analysis – Performing various statistical calculations or using data visualization tools in order to formulate observations or derive conclusions from a given dataset.

Data treatment – Techniques used to prepare a large quantity of data for data analysis.

Duplicate sample – A sample collected simultaneously with a primary sample through a common inlet probe such that the same air parcel is being sampled. This simultaneous collection is typically achieved by teeing the line from the sampler to two canisters (or other sampling media) and doubling the flow rate applied to achieve integration over the 24-hour collection period. See also *collocated sample*.

Estimate – A characteristic of the sample from which inferences on parameters can be made.

Failed screen – A pollutant concentration that is greater than its corresponding risk screening value.

Field blank – A blank used to provide information about contaminants that may be introduced during sample collection, storage, and transport. A clean sample, carried to the sampling site, exposed to sampling conditions, returned to the laboratory, and treated as an environmental sample.

Hazardous Air Pollutants (HAPs) – Those pollutants known or suspected to “cause cancer or other serious health effects, such as reproductive effects or birth defects, or adverse environmental and ecological effects” (EPA, 2016c).

Internal standard – A standard added to a test portion of a sample in a known amount and carried through the entire determination procedure as a reference for calibrating and controlling the precision and bias of the analytical method.

Mean (arithmetic), also called *average* – A measure of central tendency that is the sum of all the values of a set of measurements divided by the number of values in the set.

Measured detection – A quantifiable level or measurement of a given pollutant by a designated analytical instrument.

Method Detection Limit (MDL) – The lowest concentration at which laboratory equipment have been experimentally determined to reliably quantify concentrations of selected pollutants to a specific confidence level.

Method precision (also called *sampling and analytical precision*) – A measurement of errors associated with collecting ambient air samples and analyzing the samples in the laboratory.

Measurement Quality Objective (MQO) – Objectives designed to evaluate and control the various phases of the measurement process (sampling, preparation, analysis) to ensure that the measurements meet the overall program objective(s).

Metropolitan Statistical Area (MSA) – A geographic entity defined by the Office of Management and Budget containing a core urban area of 50,000 people or more.

Micropolitan Statistical Area – A geographic entity defined by the Office of Management and Budget containing a core urban area of at least 10,000 people but less than 50,000 people.

Mobile sources – Emitters of air pollutants that move, or can be moved, from place to place.

NATTS MQO Core analytes – A list of analytes that participating sites are required to sample and analyze for under the NATTS program.

Non-detect – A measurement that indicates the pollutant was not detected at a quantifiable level by the instrument.

Noncancer risk – The risk associated with health effects other than cancer, such as asthma.

Noncancer hazard approximation – An approximation, based on the annual average, of the Noncancer Hazard Quotient (HQ), where an HQ greater than 1.0 indicates that adverse health effects are possible. If an HQ is equal to or less than 1.0, no adverse noncancer health effects are expected as a result of exposure.

Nonpoint sources – Sources of emissions that individually are too small in magnitude or too numerous to inventory to include as individual point sources, and can often be estimated more accurately as a single aggregate source for a specific county or tribal area (EPA, 2017).

Nonroad sources – Sources of emissions from “off-road mobile sources that use gasoline, diesel, and other fuels,” and include construction equipment, lawn equipment, trains, and commercial marine vessels (EPA, 2017).

Onroad sources – Sources of emissions from “on-road vehicles that use gasoline, diesel, and other fuels,” and include both light duty and heavy duty vehicles (EPA, 2017).

Outlier – An extreme observation that is shown to have a low probability of belonging to a specified data population.

Point sources – Sources of emissions that are individually inventoried and usually located at fixed, stationary locations. Point sources include large industrial facilities but also many smaller industrial and commercial facilities, which have traditionally been included in Nonpoint sources (EPA, 2017).

Pollutants of interest – Those pollutants contributing to the top 95 percent of the total failed screens, either at the program-level or on a site-specific level, based on the risk-based screening process.

Pollution rose – A plot of the ambient concentrations versus average wind speed and direction observations; high concentrations may be shown in relation to the direction of potential emissions sources.

Precision – A measure of mutual agreement between independent measurements performed according to identical protocols and procedures. (See also *method precision* and *analytical precision*.)

Preliminary risk-based screening process – A risk-based methodology used to identify (or screen) which pollutants may pose a health risk in a given area.

Preprocessed daily measurement – A single measurement for any given pollutant for a given method for a given sample day for a specific monitoring site. The preprocessed daily measurement can be an individual sample measurement or a measurement representing the average of the duplicate (or collocated) and replicate measurements.

Quality Assurance Project Plan (QAPP) – A formal document describing in comprehensive detail the necessary quality assurance, quality control, and other technical activities that must be implemented to ensure that the results of the work performed will satisfy the stated performance criteria.

Quarterly average – The average of concentrations measured within a given calendar quarter. The quarterly average includes the substitution of zeros for all non-detects. A site must have a minimum of 75 percent valid samples compared to the total number of samples possible within a given calendar quarter for a quarterly average to be calculated.

Reference Concentration (RfC) – An estimate of continuous inhalation exposure to the human population that is likely to be without an appreciable risk of deleterious noncancer health effects over a lifetime and is used to identify (or screen) where air toxics concentrations may present a human health risk (EPA, 2015b).

Replicate samples – Repeated analyses performed on a duplicate or collocated pair of samples. Replicate analysis was also performed on select individual samples.

Risk – “The probability that damage to life, health, or the environment will occur as a result of a given hazard (such as exposure to a toxic chemical) (EPA, 2015b).”

Risk screening value – The toxicity factors upon which the preliminary risk-based screening process is based (see *preliminary risk-based screening process*).

Scalar wind speed – The wind speed without accounting for wind direction, which together make up the wind vector.

Standard deviation – A measure of the dispersion or imprecision of a sample or population distribution expressed as the positive square root of the variance and has the same unit of measurement as the mean.

Standard Operating Procedure (SOP) – A written document that details the method for an operation, analysis, or action with thoroughly prescribed techniques and steps and that is officially approved as the method for performing certain routine or repetitive tasks.

Stationary sources – Sources of emissions that include both point and nonpoint sources. See also *point sources* and *nonpoint sources*.

Risk approximation – Cancer risk and noncancer hazard approximations calculated to further the risk evaluation associated with a given pollutant of interest. See also *cancer risk approximation* and *noncancer hazard approximation*.

Toxicity Factors – Cancer UREs and noncancer RfCs used in this report for various risk-based analyses.

Toxicity-weighted emissions – An EPA-approved approach that applies weight to the quantity of emissions for a given pollutant based on toxicity, using the URE or RfC.

Unit Risk Estimate (URE) – “The upper bound excess lifetime cancer risk estimated to result from continuous exposure to an agent at a concentration of $1 \mu\text{g}/\text{m}^3$ in air” (EPA, 2015b). A URE is a screening value that is used to estimate cancer risks and to identify (or screen) where air toxics concentrations may present a human health risk.

Wind rose – A graphic used to represent wind observations for a given location; the frequency of wind directions is presented as petals positioned around a 16-point compass, and color or shading is used to represent wind speeds.
