Re: APAR Addendum and Response to Comments
Union Pacific Railroad Houston Wood Preserving Works Facility
4910 Liberty Road Facility, Houston, Texas
Post-Closure Care Permit No. HW-50343; Industrial SWR No. 31547

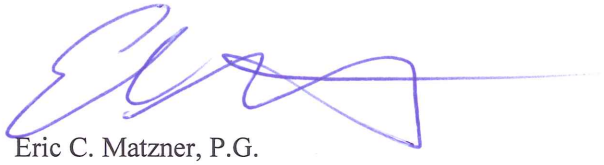
Dear Mr. Arthur:

Pastor, Behling & Wheeler, LLC (PBW), on behalf of Union Pacific Railroad Company, is providing with this letter the Affected Property Assessment Report (APAR) Addendum for the UPRR Houston Wood Preserving Works Facility (the Site). In addition to the APAR Addendum, written responses to comments provided by the Texas Commission on Environmental Quality (TCEQ) on the Revised APAR dated June 10, 2004 that are pertinent to this addendum are provided in Attachment A of this letter. The TCEQ issued a series of comment letters dated October 8, 2004, April 15, 2005, and August 1, 2005, with UPRR responses issued on November 19, 2004, June 9, 2005, and September 6, 2005. To aid in the review of the responses, the TCEQ comments and associated responses are consolidated.

If you have any questions or need additional information, please feel free to call me at (512) 671-3434 or Mr. Geoffrey Reeder of UPRR at (281) 350-7197.

Sincerely,

PASTOR, BEHLING & WHEELER, LLC



Eric C. Matzner, P.G.
Senior Hydrogeologist

cc: Waste Program Manager, TCEQ Region 12, Houston
Mr. Geoffrey Reeder, P.G., UPRR – Spring, TX

ATTACHMENT A

CONSOLIDATED RESPONSES TO TCEQ COMMENTS
UPRR HWPW REVISED APAR

1. Revise *Section 2.2.2 Water-Well Survey* (page 6) to summarize the findings of additional efforts completed to identify neighborhood water-well locations and use.

RESPONSE:

An updated water well survey was completed, as well as investigating the location of a suspected water well in the neighborhood northwest of the Site. Details of the water well inventory are provided in Section 2.0 of the APAR Addendum.

2. The following information is needed for the Tier 1 Ecological Exclusion Criteria Checklist: a) complete the assessments of the drainage ditches (SWMU 2) and inactive wastewater lagoon (AOC6); b) further evaluate the ecological habitat in the area of the drainage ditches (if affected property exists offsite along the ditch(es)) and inactive wastewater lagoon (AOC 6); and, c) use the information from 2.a and 2.b to determine if these areas meet the exclusion criteria in Part II of the checklist.

TCEQ Comment on Response to Comment (RTC) 2 – A Tier 2/3 Ecological Risk Assessment (ERA) of the southern drainage ditch will not be necessary if: a) the chemicals of concern (COCs) concentrations in soil/sediment (0-6 inches) along the southern drainage ditch are at or below background levels; or, b) the COCs concentration in soil/sediment along the southern drainage ditch are above background, but an expedited stream evaluation demonstrates that the ditch meets the qualifying criteria for an expedited stream evaluation and downstream affects are not apparent. Section 2.6.2 of the agency's 2001 Ecological Risk Assessment Guidance provides details regarding the criteria for determining if an expedited stream evaluation is appropriate, and details (sampling and analytical requirements, decision criteria) regarding the evaluation of potential downstream affects. If the ditch meets the qualifying conditions, the ditch will not need further evaluation (from an ecological standpoint) unless the downstream analyses reveal impacts. In this case the ditch would be evaluated as a secondary source of COCs.

For the inactive wastewater lagoon, we recommend that UPRR determine whether the area is predominantly wet or dry (see Section 3.9.2.6 of the agency's 2001 Ecological Risk Assessment Guidance). If UPRR determines that it is predominantly wet much like a marsh/wetland environment, then UPRR should perform a Tier 2 ERA using sediment samples collected in the former lagoon. If UPRR determines that the area is predominantly dry and the media is characterized as soil rather than sediment, we suggest that the area be evaluated to determine if the soil conditions meet the exclusion criteria of the Tier 1 Exclusion Criteria checklist. It is possible that the area could meet the disturbed ground or *de minimus* exclusion criteria at Subparts B and D (of Part II) of the checklist. If the exclusion criteria are not satisfied, UPRR would need to perform a Tier 2 ERA using soil samples collected in the former lagoon.

RESPONSE:

PBW conducted an Expedited Stream Evaluation (ESE) of the drainage ditch (SWMU 2) and the inactive wastewater lagoon (AOC 6). Details of the ESE are provided in Section 9.0. Photographic documentation of the areas is provided in Appendix 13 of the APAR Addendum.

3. Revise *Section 3.1 Identification of Source Areas* (page 8) to identify the basis for determining that an

RFI of AOCs 3, 4, 5, and 7 was not required. Please note that a survey is required for underground utilities at affected property to determine whether they are threatened or affected, or may be or are known preferential migration pathways for contamination.

RESPONSE:

Initial response to Comment No. 3 was provided by ERM in a letter dated November 19, 2004. PBW conducted an additional assessment of the underground utilities in and around the Site, as discussed in Section 3.0 of the APAR Addendum.

4. Revise *Section 3.2 Description of Source Areas* (pages 9-10) to describe how wastewater and sludge were generated and managed (conveyed, treated, and disposed) during the active life of the facility. Provide a site figure illustrating your response.

RESPONSE:

Little information on the generation and management of wastewater at the facility was found during the file review. Details from the RCRA Facility Assessment (RFA) conducted by PRC in 1993 are provided in Section 1.2 and a copy of the RFA is provided in Appendix 11 of the APAR Addendum.

5. Revise the *Section 3.4 Previous On-Site Remediation* (page 11) to provide a figure identifying the location of the two petroleum storage tank removals and the dimensions (horizontal and vertical) of previous soil removals at the drainage ditch (SWMU 2), inactive wastewater lagoon (AOC 6), and at any other SWMU/AOC. Revise the text to: a) summarize the previous soil removals and indicate how the excavated areas were restored; and, b) indicate how the southern drainage ditch became heavily contaminated.

RESPONSE:

Details of the previous remediation activities at the Site are provided in Section 1.2 and shown on Figure 1A-3 of the APAR Addendum.

6. Provide geologic cross-sections which show the information as instructed by *Attachment 2F Cross-Sections* of the APAR Form (page 9). The number of cross-sections should be adequate to illustrate the areas exceeding assessment levels (affected property) and PCLE zones for each media, and the extent of non-aqueous phase liquid (NAPL).

RESPONSE:

Revised geologic cross sections are provided in APAR Addendum Section 4.0 as Figures 4C-1 through 4C-4.

7. Complete an underground utility survey as instructed by the APAR Form. Conduct assessment, as necessary, to determine whether an underground utility is threatened, affected, or a preferential migration pathway for contamination.

RESPONSE:

The underground utility assessment is detailed in Section 3.0 of the APAR Addendum.

8. The soil assessments for the southern drainage ditch (SWMU 2) and AOC 6 are unacceptable. Therefore, propose how SWMU 2 and AOC 6 will be assessed to determine whether chemicals of concern (COCs) are present above assessment levels and critical PCLs, and if so, delineate the extent (horizontal and vertical) of the COCs to define the affected environmental media and PCLE zones.

TCEQ RTC 8 – UPRR will also assess the area along the southern drainage ditch that was excavated in 1995 and 1997. One soil/sediment sample will be collected from 0 to 6 inches every 200 feet, and another sample representative of native soil at the excavation limit will be collected every 100 feet. Regarding the excavated area at the inactive wastewater lagoon, the second sample from each proposed boring will be representative of native material (soil/sediment) at the excavation limit.

RESPONSE:

Additional soil samples were collected in 2006 to 2009 from SWMU No. 2 and AOC 6. Details of that assessment are provided in Section 4.0 of the APAR Addendum.

9. Source area soil assessment of the water treatment and boiler system (SWMU 6) components and the aboveground storage tanks (SWMU 8) is required. Therefore, propose how SWMUs 6 and 8 will be assessed to determine whether chemicals of concern (COCs) are present above assessment levels and critical PCLs, and if so, delineate the extent (horizontal and vertical) of the COCs to define the affected environmental media and PCLE zones.

RESPONSE:

Additional surface and subsurface soil samples were collected in the vicinity of SWMU No. 6 and 8, which are discussed in Section 4.0 of the APAR Addendum. Also, additional groundwater monitoring wells were installed in or around the SWMUs to evaluate COCs in groundwater in these potential source areas. Details of the groundwater investigation are provided in Section 5.0 of the APAR Addendum.

10. Identify where the cooling tower was located and propose source area assessment at this unit for chromium and any other potential COC.

RESPONSE:

The cooling tower for the boiler system was located within SWMU No. 8, as shown on Figure 3B in Section 3.0 of the APAR Addendum.

As detailed in the ERM response letter dated November 19, 2004, chromium is not a COC on the RCRA Permit, Compliance Plan or RFI Work Plan. UPRR does not propose adding chromium to the COC list because the current list of COCs are the primary indicators for wood treating facilities, as approved by TCEQ for the RFI, and no changes to site conditions or the level of understanding has occurred that warrants a change to the COCs list.

11. Specifically show where the wood treatment units and drip pads were located at the facility and demonstrate that the soil assessment especially targeted these units by the placement of borings within and immediately adjacent to these units. Propose additional soil assessment if the units and pads were not assessed as indicated above.

RESPONSE:

As shown of Figure 11A of the APAR Addendum, the Site surface soils have been well characterized with sufficient coverage to evaluate potential source areas at the Site. Details of the SWMUs and AOCs were provided in the RCRA Facility Assessment Report dated October 1993, which a copy is provided in Appendix 11 of the APAR Addendum.

12. Revise *Figure 6-2 Subsurface Soil PCLE Zone Map* to propose the following additional soil borings to delineate the extent of subsurface soil PCLE zones: a) one boring west, one boring north, and one

boring east of SB-03; b) one boring east of SB-07/SB-08; c) one boring west of MW-17 and MW-31A; d) one boring east of MW-30A; e) one boring west, one boring north, and one boring east of SB-04; and, f) one boring at SB-07/SB-08 to delineate the vertical extent of affected soils.

TCEQ RTC 12 – Responses to Comments 12.a through 12.e are accepted. Regarding Comment 12.f, UPRR will move proposed monitor well MW-55C to be at soil boring locations SB-07/SB-08. No soil samples are to be collected for assessment purposes during the drilling of MW-55C.

RESPONSE:

The subsurface soil assessment was re-evaluated for this APAR Addendum to include only soils between 5 feet and to the top of the A-TZ Unit on site, and from 15 feet to the top of the A-TZ off site. Therefore, a number of soil samples that had been collected below the water-bearing zones were not applicable for evaluating the Affected Property or PCLE Zones. Those data were used for evaluating the potential for dense non-aqueous phase liquids (DNAPL) migrating vertically. Details of the subsurface soil assessment are provided in Section 4.0 of the APAR Addendum.

13. Revise *Figure 6-2 Subsurface Soil PCLE Zone Map* to show the subsurface soil PCLE zone to be connected between onsite MW-17/MW-30A and offsite MW-32A.

RESPONSE:

Details of the subsurface PCLE zone are discussed in Section 11.0 of the APAR Addendum.

14. Revise *Figure 7-1 A-TZ Groundwater PCLE Zone Map* to propose the following additional monitor wells: a) one in between proposed MW-38A and CPT/DP-31A; b) one in between CPT-36A and CPT-37A; c) one east-northeast of MW-18A, just north of the railroad tracks, and west of Lockwood Street; d) one within the Recent Process Area (SWMU 4); e) two within the Original Process Area (SWMU 5); f) one within SWMU 6; and, g) two within SWMU 8. Also, revise *Figure 7-1* to move the locations of proposed monitor wells: a) MW-35A and MW-36A to the south; b) MW-49A to the northeast, south of the railroad tracks, and west of Lockwood Street; c) MW-50A to the north and just south of the railroad tracks; and, d) MW-51A to the north-northeast and just south of the railroad tracks.

TCEQ RTC 14 – Responses to Comments 14.a through 14.d and 14.f are accepted. Regarding Comments 14.e and 14.g, UPRR will complete one temporary monitor well at soil boring locations SB-07/SB-08 and one temporary monitor well near the center of the Aboveground Storage Tank Area to further access the groundwater quality of the A-Transmissive Zone for non-aqueous phase liquids (NAPL) and dissolved phase COCs.

RESPONSE:

Fourteen additional A-TZ monitoring wells and two small diameter piezometers (installed near SB-07/SB-08 (TPZ-01) and within SWMU no. 8 (TPZ-02)) were installed at the Site from August 2006 through January 2009. Groundwater data collected in January-February 2009 from the groundwater monitoring network indicate that COCs in the A-TZ have been delineated to TRRP Residential Assessment Levels (RALs). Details of the groundwater assessment are provided in Section 5.0 of the APAR Addendum.

15. Revise *Figure 7-3 C-TZ Groundwater PCLE Zone Map* to propose the following additional monitor wells: a) one east of MW-18C, south of MW-44C, and just north of the railroad tracks; b) one west of MW-18C within SWMU 8; and, c) one within SWMU 5. Also, revise *Figure 7-3* to move the locations of proposed monitor wells: a) MW-52C and MW-55C to the south; and, b) MW-47C to the

north-northwest and just south of the railroad tracks.

RESPONSE:

From August 2006 through January 2009, three additional C-TZ monitoring wells were installed, and in June 2008, hydropunch samples from the CPT/ROST investigation were collected. Based on this data, COCs in the C-TZ are delineated to RALs. Details of the assessment are provided in Section 12.0 of the APAR Addendum.

16. Pentachlorophenol (PCP) is a COC at the facility. Chlorinated dibenzodioxins and chlorinated dibenzofurans (collectively referred to as dioxins) exist as impurities in commercial grade PCP and are considered companion products (30 TAC 350.71(k)) to PCP. Therefore, propose additional assessment of the affected property for dioxins to determine whether they are present above assessment levels and critical PCLs at source areas, and if so, delineate the extent (horizontal and vertical) of the dioxins to define the affected environmental media and PCLE zones. A COC-specific approach for evaluating dioxins in soil is described in 30 TAC §350.76(e) and is also applicable to groundwater.

TCEQ RTC 16 - To determine whether dioxins are a COC, UPRR will also collect one soil sample at soil boring locations SB-07/SB-08 and one soil sample at SB–04. The soil samples will be collected from approximately 2-4 feet and analyzed for pentachlorophenol (PCP) and dioxins. The analytical methods used will be capable of quantifying PCP and dioxins to a concentration that is at or below the residential assessment level.

RESPONSE:

Surface soil samples were collected near SB-07/SB-08 (TW-01 (2-4')) and near SB-04 (MW-52A (2-4')) and were analyzed for dioxins (chlorinated dibenzodioxins and dibenzofurans). The results were less than RALs for surface soils. Details of the evaluation are provided in Section 4.0 of the APAR Addendum.

17. Revise the text and tables in *Appendix F Screening COCs from PCL Development* to identify the criteria used to screen COCs from PCL development as 30 Texas Administrative Code §350.71(k)(1), §350.71(k)(2)(A), §350.71(k)(2)(B) or (C), §350.71(k)(2)(D), §350.71(k)(2)(E), or §350.71(k)(3).

RESPONSE:

An updated COC screening evaluation is provided in Section 10.0 of the APAR Addendum to reflect the criteria used to screen COCs from PCL development per 30 Texas Administrative Code §350.71(k).

18. PCP PCLE Zones - UPRR will propose surface soil sample locations to confirm the PCP results of the 1997 soil data and to confirm the location and extent of the protective concentration level exceedance (PCLE) zones for PCP which were based in part on the 1997 soil data.

RESPONSE:

Details of the PCP resampling evaluation are provided in Section 4.0 of the APAR Addendum.

19. Analytical Data Reporting - UPRR will comply with §350.54(h) for reporting nondetected results. If the analytical data package from the laboratory includes nominal terms, UPRR will either request the laboratory to follow TRRP 13 and report the data in compliance with §350.54(h) or UPRR will convert the acronyms for nondetected results (e.g., "ND" or "BDL" for "not detected" or "below detection limit", respectively) to the sample quantitation limits (SQLs), for example, "<2.0 ug/L". UPRR will then revise the data summary tables and figures to report the nondetected results as less than the value of the SQL.

RESPONSE:

Figures and tables in the APAR Addendum report data in accordance with TRRP 13 Guidance document.

20. All Summary Data Tables - As done for the detected results, UPRR will revise Tables 6-3, 6-4, 7-3 and 7-4 to highlight the SQLs exceeding the critical protective concentration level (cPCL). Also, Table 6-3 will be revised to identify the sample depth interval for all the soil samples. Finally, the text associated with the tables will discuss the findings and conclusions drawn from the data in the tables.

RESPONSE:

Soil and groundwater summary tables provided in the APAR Addendum highlight SQLs that exceed the cPCLs.

21. All PCLE Zone Figures - UPRR will revise all PCLE zone figures to present both the detected concentrations and the SQLs for the indicator COCs used to define the nature and extent of the PCLE zones in soil and groundwater. As done for the detected results, UPRR will highlight the SQLs exceeding the cPCL. Also, the legends for the figures will be revised to identify the cPCL for each indicator COC. Finally, the text associated with the figures will describe the logic used to derive the indicator COCs.

RESPONSE:

Soil and groundwater figures provided in the APAR Addendum show the SQLs that exceed the cPCLs.

22. Total Petroleum Hydrocarbons (TPH) Assessment - The limited soil sampling for TPH shows that TPH is a COC in surface and subsurface soil. UPRR needs to re-evaluate the soil cPCL for TPH which is currently 30 mg/Kg and then verify the PCLE zones for TPH have been adequately defined to the cPCL.

RESPONSE:

Through discussions with the TCEQ, we have argued that the site-specific COCs (i.e., benzo(a)pyrene, naphthalene, etc.) are better indicators of impacts to media at the Site than TPH concentrations, in which the TCEQ agreed in a meeting. The rationale is that evaluating the Site using site-specific COCs will be a more conservative assessment of the Site compared to a TPH PCL (i.e. following TRRP-27 Guidance). Therefore, the Affected Property Assessment focused on the site-specific COCs, not including TPH.

NAPL Triggers[1]

NAPL Response Action Triggers		Description of Triggers
☐	No NAPL response action triggers	No NAPL triggers have been observed in any assessment zones (vadose, capillary fringe and saturated), nor in surface water or sediments
☐	NAPL vapor accumulation is explosive	NAPL vapors accumulate in buildings, utility and other conduits, other existing structures, or within anticipated construction areas at levels that are potentially explosive (≥ 25% LEL)
☐	NAPL zone expanding	NAPL zone is observed to be expanding using time-series data
☒	Mobile NAPL in vadose zone	NAPL zone is observably mobile, or is theoretically mobile based on COC concentrations and residual saturation
☐	NAPL creating an aesthetic impact or causing nuisance condition	NAPL is responsible for objectionable characteristics (e.g., taste, odor, color, etc.) resulting in making a natural resource or soil unfit for intended use
☐	NAPL in contact with Class 1 groundwater	NAPL has come in actual contact with saturated zone or capillary fringe of a Class 1 GWBU
☒	NAPL in contact with Class 2 or 3 groundwater	NAPL has come in actual contact with saturated zone or capillary fringe of a Class 2 or Class 3 GWBU
☐	NAPL in contact with surface water	Liquid containing COC concentrations that exceed the aqueous solubility in contact with surface water via various migration pathways or direct release to surface water
☐	NAPL in or on sediments	Liquid containing COC concentrations that exceed the aqueous solubility impact surface water sediments via migration pathway or a direct release

[1] NAPL evaluation based on well installations and gauging events during 2004 through 2009.

CONCLUSIONS AND RECOMMENDATIONS

Assessment Results

The following media have been evaluated for potential chemical of concern (COC) releases as part of investigations conducted at the Union Pacific Railroad (UPRR) Houston Wood Preserving Works Facility at 4910 Liberty Road, Houston, Texas, (the Site): surface soils, subsurface soils, and groundwater. Both the soil and groundwater exposure pathways were evaluated as part of the Site assessment and considered to be complete and/or anticipated to be complete.

The Site is located within unoccupied industrial land, and it is anticipated that the Site will remain commercial/industrial for the foreseeable future. The surrounding properties within a 500-foot radius of the Site consist of residential to the northwest, north, southeast, and south. The UPRR Englewood Yard, commercial/industrial property, is located to the east of the Site. An area of undeveloped land and abandoned houses are located west of the Site. The 500-foot radius field survey demonstrated no current potential groundwater receptors within the residential neighborhood. No water wells, water tanks, cisterns, or windmills, or surface water bodies were encountered. The nearest surface water body is Buffalo Bayou, located approximately 1.6 miles southwest of the Site. The potential for lateral migration of groundwater from the Site to the southwest approximately 8,500 feet to Buffalo Bayou is not likely.

Geological logs from soil/monitoring well borings and cone penetrometer testing (CPT) borings were reviewed to evaluate the subsurface geology at the Site. The lithology at the Site is consistent with the published descriptions of the Beaumont Formation. Site stratigraphy from the ground surface to a depth of approximately 135 feet is separated into the following units: Fill Material (0-3 ft bgs), A-Cohesive Zone (A-CZ) (8 to 15 feet thick); A-Transmissive Zone (A-TZ) (4 to 21 feet thick); B-Cohesive Zone (B-CZ) (6 to 19 feet thick); B-Transmissive Zone (B-TZ) (discontinuous, where present, 3 to 10 feet thick); C-Cohesive Zone (C-CZ) (8 to 20 feet thick); C-Transmissive Zone (C-TZ) (10 to 13 feet thick); D-Cohesive Zone (D-CZ); and D-Transmissive Zone (D-TZ).

A total of 88 groundwater monitoring wells and three temporary wells have been installed on and off-site in the various transmissive zones. Groundwater in A-TZ and B-TZ generally flows across the Site to the east; groundwater flow in the C-TZ flows from northeast to southwest, and groundwater flow in the D-TZ appears to flow to the northwest.

Baildown tests in the B-CZ wells conducted in March 2009 at monitoring wells MW-33B, MW-49B, and MW-63B show estimated yields representative of Class 3 groundwater (<150 gpd). Therefore, for establishing the PCL exceedance zone at the Site, Residential PCLs and $^{GW}GW_{Class3}$ groundwater PCLs were used to evaluate groundwater COCs in the B-CZ. Class 2 groundwater PCLs were used to evaluate groundwater in the transmissive zones (i.e., A-TZ, B-TZ, C-TZ and D-TZ).

Target COCs in soil and groundwater media were evaluated using the March 2009 TCEQ TRRP Residential PCLs to establish the Affected Property. Surface and subsurface soil data collected from 1997 through February 2009 were utilized to determine COC exceedances in soil. Groundwater data from the most recent sampling event (January/February 2009) were utilized to determine COC exceedances in groundwater.

Comparing the surface and subsurface soil analytical data to the Residential Assessment Levels (RALs) (lowest PCL between $^{Tot}Soil_{Comb}$ and $^{GW}Soil_{Ing}$ (Tier 1 and 2)), concentrations of the following COCs exceeded their respective RALs in the surface and subsurface soils:

Surface Soils
- 1,2-Diphenylhydrazine
- 2,4-Dinitrotoluene
- 2-Methylnaphthalene
- Benzene
- Benzo(a)anthracene
- Benzo(a)pyrene
- Dibenzofuran
- Fluoranthene
- Naphthalene
- Pentachlorophenol
- Phenanthrene

Subsurface Soils
- 2,4-Dimethylphenol
- 2-Methylnaphthalene
- Benzene
- Benzo(a)pyrene
- Dibenzofuran
- Naphthalene

Comparing the maximum groundwater concentrations from the January/February 2009 groundwater sampling event, 2008 CPT Hydropunch event, and temporary well (TW) sampling event in March 2007 to RALs, concentrations of 40 target COCs exceeded their respective RALs or had a Sample Detection Limit (SDL) greater than the RAL (>SDL):

VOCs
- 1,1,2,2-Tetrachloroethane (>SDL, A-TZ, TW only)
- 1,1,2-Trichloroethane (>SDL, A-TZ, TW only)

SVOCs
- 2,4-Dimethylphenol (A-TZ only)
- 2-Methylnaphthalene (A-TZ, B-TZ, C-TZ)

VOCs

- 1,1-Dichloroethene (>SDL, A-TZ, TW only)
- 1,2-Dichloroethane (>SDL, A-TZ, TW only)
- 1,2-Dichloroethene (total) (>SDL, A-TZ, TW only)
- 1,2-Dichloropropane (>SDL, A-TZ, TW only)
- Benzene (A-TZ, B-TZ, C-TZ)
- Bromodichloromethane (>SDL, A-TZ, TW only)
- Bromomethane (>SDL, A-TZ, TW only)
- Carbon Tetrachloride (>SDL, A-TZ, TW only)
- cis-1,3-Dichloropropene (>SDL, A-TZ, TW only)
- Dibromochloromethane (>SDL, A-TZ, TW only)
- Dichloromethane (B-TZ only)
- Ethylbenzene (A-TZ, TW only)
- Methylene Chloride (>SDL)
- Tetrachloroethene (>SDL, A-TZ, TW only)
- Toluene (A-TZ only)
- trans-1,3-Dichloropropene (>SDL, A-TZ, TW only)
- Trichloroethene (>SDL, A-TZ, TW only)
- Vinyl Chloride (>SDL, A-TZ, TW only)
- Xylenes (total) (A-TZ, TW only)

SVOCs

- Acenaphthene (C-TZ only)
- Benz(a)anthracene (A-TZ, B-TZ, C-TZ)
- Benzo(a)pyrene (A-TZ, B-TZ, C-TZ)
- Benzo(b)fluoranthene (A-TZ, TW only)
- Benzo(k)fluoranthene (A-TZ, TW only)
- Bis(2-ethylhexyl)phthalate
- Carbazole (A-TZ, TW only)
- Chrysene (C-TZ only)
- Dibenzo(a,h)anthracene (A-TZ, TW only)
- Dibenzofuran (A-TZ, B-TZ, C-TZ)
- Fluoranthene (C-TZ only)
- Fluorene (C-TZ only)
- Indeno(1,2,3-cd)pyrene (A-TZ, TW only)
- Naphthalene (A-TZ, B-TZ, C-TZ)
- n-Nitrosodi-n-propylamine (A-TZ, TW only)
- Phenanthrene (C-TZ only)
- Pyrene (C-TZ only)

Based on the original APAR (ERM, 2000) and Revised ARAR (ERM, 2004), the Site passed the TCEQ Tier 1 Ecological Exclusion Criteria Checklist. However, as stated in the TCEQ comment letters on the Revised APAR dated October 8, 2004 and April 15, 2005 (Comment No. 2 and RTC 2, respectfully), the TCEQ requested that the Inactive Wastewater Lagoon (AOC 6) and South Drainage Ditch southwest of AOC 6 be further investigated to assess if a Tier 2/3 Ecological Risk Assessment (ERA) was necessary to evaluate protectiveness for ecological receptors. Instead of conducting a Tier 2 Ecological ERA, an Expedited Stream Evaluation (ESE) was conducted on the man-man ditch southwest of AOC 6. The results of the ESE indicated that the drainage ditch was not a viable habitat for ecological communities and that a Tier 2 ERA was not necessary. The Inactive Wastewater Lagoon (AOC 6) was evaluated to determine if a response action to address human health would remove potential ecological exposures under the reasoned justification clause. Based on the COCs to be addressed, a response action for soils

would address the ecological pathway.

Critical soil PCLs were established for the Site by using the lower commercial/industrial PCLs for on-site soils and residential PCLs for off-site soils for the following pathways: $^{Tot}Soil_{Comb}$; $^{Air}Soil_{Inh\text{-}V}$ (Tier 1 or 2); and $^{GW}Soil_{Ing}$ (Tier 1 or 2). Comparing the maximum surface and subsurface soil analytical data to the critical commercial/industrial PCLs for on-site and residential PCLs for off-site, concentrations of the following COCs exceeded their respective critical PCLs:

On-Site

Surface Soils
- 1,2-Diphenylhydrazine
- 2,4-Dinitrotoluene
- 2-Methylnaphthalene
- Benzene
- Benzo(a)anthracene
- Benzo(a)pyrene
- Dibenzofuran
- Naphthalene
- Pentachlorophenol

Subsurface Soils
- 2-Methylnaphthalene
- Benzene
- Naphthalene

Off-Site

Surface Soils
- Benzo(a)anthracene
- Benzo(a)pyrene

Subsurface Soils
- None

Groundwater analytical data were compared to the TCEQ TRRP Residential Groundwater PCLs, dated March 2009, assuming the source area greater than 0.5 acre in size (30-acre source area). Critical PCLs were established as the lesser value between residential $^{GW}GW_{Ing}$ and $^{Air}GW_{Inh\text{-}V}$ PCLs. The January-February 2009 groundwater analytical data and CPT Hydropunch groundwater data collected in August 2008 were evaluated for establishing the groundwater PCLE zone. These analytical data are the most representative groundwater data for the Site. Of the site-specific COCs analyzed in groundwater, concentrations of 17 target COCs exceeded their respective critical PCLs (cPCLs):

VOCs
- Benzene
- Dichloromethane
- Toluene

SVOCs
- 2,4-Dimethylphenol
- 2-Methylnaphthalene
- Acenaphthene
- Benz(a)anthracene
- Benzo(a)pyrene
- Bis(2-ethylhexyl)phthalate
- Chrysene
- Dibenzofuran
- Fluoranthene
- Fluorene
- Naphthalene
- Pentachlorophenol
- Phenanthrene
- Pyrene

NAPL Discussion

Evidence of both light non-aqueous phase liquids (LNAPL) and dense non-aqueous phase liquids (DNAPL) has been observed in the vadose zone and in the GWBUs. Approximately 1.2 feet of LNAPL has been observed in the A-TZ at temporary well TW-02 within the AST Area (SWMU No. 8). DNAPL is present in A-TZ on the northern edge and off site to the north. Traces of DNAPL are present in monitoring wells MW-33A and MW-17C, and 6.2 feet of DNAPL has been observed at MW-32A. Monitoring wells MW-20A, MW-26A, MW-30A, MW-35A, MW-36A, and MW-57A installed in A-TZ show the lateral extent of the DNAPL is sufficiently delineated in this area.

DNAPL was detected in the B-TZ along the western boundary of the Site at MW-12B and MW-41B. The DNAPL present on the west side of the facility had a maximum thickness of 21.02 feet observed at MW-41B in February 2009. DNAPL was not detected in monitoring wells MW-38B, MW-39B, MW-40B and MW-P-11, which indicates sufficient horizontal delineation of the DNAPL. DNAPL was detected in one of the wells completed in the aquitard B-CZ located off site to the north of the Recent Process Area. Approximately 5.6 feet of DNAPL was observed at MW-33B in February 2009.

DNAPL is present in the C-TZ extending from the northeast side of the Site at MW-23C to approximately 900 feet off site to the northeast near MW-46C. DNAPL was observed in on-site monitoring well MW-23C, and off-site monitoring wells MW-25C, MW-34C, MW-44C, MW-45C, and MW-46C. Maximum

DNAPL thicknesses observed in the C-TZ during the February 2009 sampling event was 10.7 feet at MW-34C and 9.6 feet at MW-45C.

Data Gaps and Response Actions

Additional surface soil sampling is necessary to delineate COCs off-site north of the Site.

The future land use for the Site is assumed to be classified as commercial/industrial. The Site is covered with crushed gravel and concrete, but has the potential for human health exposure to COCs in the surface soils. UPRR will evaluate developing a response action to address the surface and subsurface soil PCLE zones at the Site in the Response Action Plan (RAP). To address the groundwater PCLE zone, a Plume Management Zone (PMZ) will likely be established with a demonstration of recoverability for the LNAPL and DNAPL that will be provided in the RAP.

UPRR is currently evaluating semi-annual groundwater monitoring for selected wells (i.e., off-site and downgradient perimeter wells) and annual groundwater monitoring to monitor geochemical trends and evaluate monitored natural attenuation of COCs in groundwater for establishing the PMZ.

CHRONOLOGY

Below is a summary of the site investigation and regulatory chronology at the UPRR Former Houston Wood Preserving Works facility (the Site).

Date	Description
May 13, 1991	RCRA Permit Application submitted by Southern Pacific Transportation Company (SPTCo)
October 1993	RCRA Facility Assessment completed on behalf of U.S. EPA by PRC Environmental Management, Inc.
June 20, 1994	Permit No. HW-50343-000 and Compliance Plan CP-50343-000 issued by Texas Natural Resources Conservation Commission (TNRCC).
August 19, 1994	Operation and Maintenance Plan and Compliance Schedule submitted on behalf of SPTCo
September 7, 1994	Revised Compliance Schedule submitted on behalf of SPTCo
September 16, 1994	Extent of Contamination (EOC) Work Plan submitted on behalf of SPTCo
October 14, 1994	RCRA Facility Investigation (RFI) Work Plan submitted on behalf of SPTCo
November 3, 1994	Revised Compliance Schedule approved by TNRCC
January 10, 1995	Operation and Maintenance Plan approved by TNRCC
September 29, 1995	EOC Work Plan approved by TNRCC
October 16, 1995	RFI Work Plan approved by TNRCC
May 23, 1996	Phase 1 RFI/EOC Report submitted on behalf of SPTCo by Terranext
November 26, 1996	EOC portion of the Phase 1 RFI/EOC Investigation Report approved by TNRCC
January 13, 1997	RFI portion of the Phase 1 RFI/EOC Investigation Report approved by TNRCC
February 13, 1998	Phase 2-A RFI/EOC Investigation Report submitted to TNRCC on behalf of UPRR by ERM-Southwest, Inc. (ERM).
April 27, 1998	Interim Stabilization Measures Report – Southern Drainage Ditch, submitted to TNRCC on behalf of UPRR by ERM.
September 10, 1999	Phase 2-B RFI/EOC Investigation Report submitted to TNRCC on behalf of UPRR by ERM
February 20, 2000	Letter submitted to the TNRCC regarding proposed Phase 2-C investigation for further delineation of off-site areas
July 10, 2000	Affected Property Assessment Report for On-Site Property (On-Site APAR) submitted to TNRCC on behalf of UPRR by ERM.
November 6, 2000	TNRCC provides comments to On-Site APAR.
January 9, 2001	Initial response to November 6, 2000 TNRCC comments.

Date	Description
July 5, 2001	Follow-up response to November 6, 2000 TNRCC comment letter on the On-Site APAR submitted to TNRCC on behalf of UPRR.
November 7, 2001	TNRCC provides comments to July 5, 2001 response letter.
June 10, 2004	Revised APAR submitted to the TCEQ (Texas Commission on Environmental Quality) by ERM, Inc. on behalf of UPRR
October 8, 2004	TCEQ Comment Letter on Revised APAR
November 19, 2004	UPRR Response to October 8, 2004 TCEQ Letter
April 15, 2005	TCEQ Response to UPRR Response Letter dated November 19, 2004
June 9, 2005	UPRR Response to TCEQ Letter dated April 15, 2005
August 1, 2005	TCEQ Response to UPRR Response Letter dated June 9, 2005
September 6, 2005	UPRR Response to TCEQ Response Letter dated August 1, 2005
April and August 2006	ERM conducted additional soil and groundwater investigation
January 2007	Pastor, Behling & Wheeler, LLC (PBW) conducts additional soil and groundwater investigation
July 2008	PBW conducts additional CPT-ROST and groundwater investigation
January 2009	PBW conducts additional soil and groundwater investigation.

NOTE: The above summary does not include routine activities such as Semiannual Ground Water Monitoring Reports.

SECTION 1.0 PROPERTY INFORMATION

Section 1.1 Physical Location

Property Location and Land Use

Details of the property location, use, topography, and weather have been provided for the Union Pacific Railroad (UPRR) Houston Wood Preserving Works Facility (the Site) at 4910 Liberty Road, Houston, Texas, (the Site) in the following documents:

- Affected Property Assessment Report (APAR), dated June 10, 2000 (ERM, 2000); and
- Revised APAR dated June 10, 2004 (ERM, 2004).

Section 1.2 Affected Property and Sources of Release

History and Operations

Details of the history and previous operations at the Site have been discussed in length in the previously submitted APAR (ERM, 2000) and Revised APAR (ERM, 2004), as well as the RCRA Facility Assessment (RFA) Report (PRC, 1993), which a copy is provided in Appendix 11.

Information on how the facility managed wastewater and sludge material is relatively sparse. Based on the information provided in the RFA, the following solid waste management units (SWMUs) and areas of concern (AOCs) generated, managed, or treated wastewater (Figure 1A-1):

- Southern Drainage Ditch (SDD) (SWMU No. 2)
- Recent Process Area (SWMU No. 4)
- Water Treatment and Boiler System (SWMU No. 6)
- Tank Car Storage Area (SWMU No. 7)
- Aboveground Storage Tank (AST) Area (SWMU No. 8)
- Former Sap Water Treatment Tank (SWMU No. 10)
- Oil/Water Separators (SWMU No. 11)
- Inactive Wastewater Lagoon (AOC No. 6)

As stated in the RFA, sap wastewater from the retort area was discharged into the SDD (SWMU No. 2) and flowed along the SDD to the Inactive Wastewater Lagoon (AOC 6), located southwest of the SDD, until 1975. The facility then discharged sap water from 1975 through 1979 into the City of Houston sanitary sewer under a wet industrial permit, which was revoked by the city in 1979 because of elevated levels of phenols, pH, temperature, and oil and grease in the discharge water. From 1979 through 1984, SPTCo stored wastewater in the Sap Water Treatment Tank (SWMU No. 10) and then transferred to tank cars within the Tank Car Storage Area (SWMU No. 7) for off-site disposal. The tank cars were used to store sap waste water and tank bottoms.

The Water Treatment and Boiler System (SWMU No. 6) was used to generate steam to heat the wood-treatment retort cylinders (PRC, 1993). A cooling tower was also part of the water treatment process. Figure 1A-2 shows the layout of the wastewater system, water treatment system, and oil/water separators at the Site.

Project Overview

Affected Property

This APAR Addendum addresses the Affected Property based on the series of site investigations to satisfy the RCRA Facility Investigation (RFI) and Extent of Contamination (EOC) Investigation from 1995 through 2009. The investigation follows the rules and guidance for the TCEQ Texas Risk Reduction Program (TRRP).

Impacts identified within the Affected Property are attributed to historical releases associated with the Site activities that occurred between 1911 and 1984. Using soil data and most recent groundwater data collected from the Site, an updated Affected Property map for the impacted media was prepared (Figure 1B).

Previous On-Site Remediation

As detailed in the Revised APAR (ERM, 2004), the following remedial activities have been conducted at the Site:

- Inactive Wastewater Lagoon (AOC 6) excavation;
- RCRA Surface Impoundment Closure (SWMU No. 1);
- Underground Storage Tank (UST) Removal (SWMU No. 9, AOC 7, and 3,700-gal UST); and

- Ditch Remediation/Interim Stabilization Measures (SWMU No. 2)

Locations of these previously remediated areas are shown on Figure 1A-3. Details for the soil removal and how the excavated areas were restored are provided below.

RCRA Surface Impoundment Closure

The closed Surface Impoundment was constructed in 1979/1980 in cooperation with the Texas Department of Water Resources (TDWR) to respond to the presence of creosote-affected soils and debris located within the Inactive Wastewater Lagoon (AOC 6) that extended on off-site property directly adjacent to the southwestern border of the site. The Surface Impoundment was not constructed for the purpose of disposing of waste material from the facility; rather, it was a non-operating (i.e., one-time use) waste impoundment from the excavation activities at the Inactive Wastewater Lagoon (AOC 6). Its only purpose was for the on-site storage of off-site creosote-affected soil and debris. On October 17, 1980, SPTCo informed the TDWR of the inactive and closed status of the impoundment.

Subsequently, the impoundment was closed pursuant to the Texas Water Commission (TWC) approved closure plan in 1984. As part of the closure, 5,065 cubic yards of affected materials were removed when the surface impoundment was excavated to a depth of approximately seven feet. Based on existing records, no waste material was left in the impoundment after the 1984 closure activities. The impoundment was subsequently backfilled with clean fill material, vegetated and closed. The closure activities were documented in an April 1984 report by Rollins Environmental Services, Inc.

Underground Storage Tank Removal

Three USTs have been removed from the site:

1. A 2,000-gallon gasoline UST (UST No. 44-023-05, TCEQ LPST No. 97929, SWMU No. 9) and ancillary equipment was excavated and removed from service in June 1990 (SPES, 1990 and SPTC, 1993);
2. A 200-gallon gasoline UST (UST No. 44-023-21, AOC No. 7) was excavated and removed from service in June 1990 (SPES, 1990); and
3. A 3,700-gallon UST and ancillary equipment was removed from service in January 1998 in accordance with TNRCC Petroleum Storage Tank Division requirements (DCC, 1998). The tank was removed from service, excavated, and disposed.

These UST closures were documented in Tank Closure/Removal Reports (Southern Pacific Transportation Company (SPTC), 1993, SP Environmental Services (SPES), 1990 and Cornish & Co., 1998). Details of the excavation and backfilling are provided below.

As provided in the UST Removal Report (SPTC, 1993), the 2,000-gallon UST (approximately 12 feet long and 5.5 feet in diameter) was removed and soils were overexcavated approximately 20 feet long, 16 feet wide, and 11 feet deep. Approximately 100 cubic yards of soil was excavated. The excavation was backfilled with local sourced fill material (SPTC, 1993). Based on a letter from SPTC to the TWC District office, SPTC attempted to conduct further excavation of the tank hold in 1992, but ceased work when "discolored soils that did not appear to be related to a release or potential release from UST No. 44-023-05)" was encountered in the tank hold (SPTC, 1993).

The 200-gallon UST (approximately 4 feet long and 3 feet in diameter) was removed and soils were overexcavated to approximately 6 feet long, 5 feet wide, and 6 feet deep (SPES, 1990). Approximately 20 cubic yards of soil were removed and the excavation was filled with fill material from a local source. Descriptions of the contamination in the tank hold included "tar-like material, not from the tank." (SPES, 1990).

Based on the Release Determination Report (RDR) prepared by David Cornish & Company (DCC) dated January 1998, no additional soil excavation around the tank hold was performed during the closure of the 3,700-gallon UST. The tank hold was backfilled with the soil excavated to extract the UST, and also filled with select fill material (DCC, 1998).

Ditch Remediation/Interim Stabilization Measures (SWMU No. 2)

As detailed in the APAR and Revised APAR, SPTC initiated in 1995 remediation activities along a portion of the Southern Drainage Ditch (SWMU 2) beginning approximately 400 feet west of the Site and continuing approximately 290 feet further west was excavated. The remediation consisted of stabilizing with lime and excavating approximately 125 tons of affected ditch material that was transported for off-site incineration. No information was located on the material used to backfill the ditch.

A Interim Stabilization Measures (ISM) phase was conducted in 1997 of the SWMU No. 2 where visibly-affected soil was excavated from the ditch beginning at the east extend of the initial excavation and extending eastward to near the southwest corner of the Site. A total of 71 truck loads of material,

including approximately 850 cubic yards of soil and other materials (e.g., vegetation, municipal trash, sheet piling), were manifested and transported to the Waste Management, Inc. Atascocita Landfill for disposal. Approximately 750 cubic yards of clean clay fill was placed in the ditch, and was compacted by the placement equipment (i.e. dozer) used to place and grade the fill. The ditch was graded to conform approximately to the original ditch shape and grade (ERM, 1998).

These ditch remediation activities were documented in the ISM Report dated April 27, 1998 (ERM, 1998). The approximate extent of both ISM activities are shown on Figure 1A-3.

Section 1.3 Geology/Hydrogeology

Regional Geology and Hydrogeology

Details of the regional geology have been provided in the APAR (ERM, 2000) and Revised APAR (ERM, 2004).

Site-Specific Geology/Hydrogeology

The site-specific geology and hydrogeology has been described in detail in the previous APAR and Revised APAR. However, as part of the supplemental investigation activities, additional lithologic data were collected from a fourth water bearing zone, labeled D-Transmissive Zone (D-TZ). Geological logs from soil and monitoring well borings and cone penetrometer testing (CPT) borings conducted from 2004 through 2009 (Appendix 6) were used to supplement the existing subsurface geology information at the Site. Updated hydrogeologic cross sections are presented in Section 4.0 – Soil Assessment as Figures 4C-1 through 4C-4, with cross section location map presented on Figure 1B. Consistent with the previous reports for the Site (ERM, 2000 and 2004), the stratigraphy from the ground surface to a total depth of approximately 135 feet below ground surface is separated into the following units:

- Fill Material - Fill material is present from ground surface to a typical depth of approximately three ft bgs. Visual observations of the fill material indicate that the fill is primarily a mixture of gravel, clay, construction debris, and railroad ties. The fill material is underlain by the A-CZ.

- A-Cohesive Zone (A-CZ) - The A-CZ ranges in thickness from approximately 8 to 15 feet and was encountered in all of the CPT soundings and borings. Based on lithologic descriptions from boring logs for MW-10A, MW-10B, and MW-11A, the A-CZ generally consists of gray silty clay. The silty clay is stiff to very stiff, laminated, moist, and contains indications of plant material, calcium carbonate, iron oxide nodules, roots, and sandy clay lenses. The A-CZ is underlain by the A-TZ.

- A-Transmissive Zone (A-TZ) - The CPT soundings and boring logs indicate that the A-TZ is a continuous silty sand and sand layer beneath the Site. The A-TZ is thickest on the eastern portion of the property (approximately 21 feet thick), and gradually thins from east to west (to less than four feet thick). Based on lithologic descriptions from boring logs for MW-10A, MW-10B, and MW-11A, the A-TZ consists of light greenish-gray to light gray sand and silty sand that is very fine-grained, wet, and contains some natural organic debris and approximately 10 to 25 percent clay. The A-TZ is underlain by the B-CZ.

- B-Cohesive Zone (B-CZ) - The B-CZ is a layer of cohesive soils (mostly clays, silty clays, sandy clays, and clayey silts) ranging in thickness from approximately 6 to 19 feet. The B-CZ was encountered in all the CPT soundings. Based on the boring logs from the Point of Compliance (POC) well nests (i.e., MW-10A/MW-10B and MW-11A/MW-11B), the B-CZ in the area is comprised of clay, silty clay, and sandy clay. It is mottled gray and reddish brown, very stiff to hard, and moist with a high plasticity. The unit also contains thin seams of silty sand, thin carbonate clayey gravel and nodule seams (~0.1 feet thick), and slickensides, as seen in boring logs MW-33B and MW-63B. The B-CZ is underlain by the B-TZ or the C-CZ where the B-TZ is absent (i.e., toward the northeast portion of the Site). Where the B-TZ is absent, the clay zone is referred to as the B/C-CZ, and ranges in thickness from 34 to 39 feet.

- B-Transmissive Zone (B-TZ) - The B-TZ is a discontinuous sand layer that underlies the B-CZ in the western portion of the site only, and is not present in the eastern portion of the Site. The B-TZ appears to pinch out between MW-35B and MW-33B. Where present, the B-TZ is approximately 3 to 10 feet thick and is present at approximately 25 to 35 ft bgs. The B-TZ consists of silty sand and sand that is mottled brown and gray, very fine-grained, and very dense in consistency. Where present, the B-TZ is underlain by the C-CZ.

- C-Cohesive Zone (C-CZ) - The C-CZ is a layer of cohesive soils (primarily) that underlie the B-TZ to the west and the B-CZ to the east. The C-CZ is approximately 8 to 20 feet thick. Based on boring logs from MW-12C and MW-18C, the C-CZ consists of silt and clayey silt that is reddish brown, firm in consistency, has low plasticity, and contains minor amounts of sand. The top of the C-CZ occurs at depths ranging from 35 to 50 ft bgs and is underlain by the C-TZ.

- C-Transmissive Zone (C-TZ) - The C-TZ is a silt and silty sand layer 10 to 13 feet thick that underlies the C-CZ and is present at approximately 60 to 75 ft bgs. Based on the boring logs from MW-12C and MW-18C, the C-TZ consists of silty sand that is reddish brown, and very fine-grained. The C-TZ overlies reddish brown clay.

- D-Cohesive Zone (D-CZ) - The underlying clay below the C-TZ has been designated the D-CZ. The unit was fully described in four locations (GB-1, MW-59D, MW-665D, and MW-66D). The unit consists of clay and silty clay, red to yellowish-red in color, and very hard and stiff. The D-CZ ranges in thickness from 17 feet to 36 feet thick.

- D-Transmissive Zone (D-TZ) - The D-TZ is a series of silty sand layers with minor amounts of thin clay intervals underlying the D-CZ unit with the top of the unit present at approximately 85 to 104 ft bgs. The D-TZ consists of silty sand that is light yellowish brown to light brown, and very fine to fine grained. The zone also has interbedded reddish brown and gray silty clay intervals. The base of the unit was encountered in MW-59D at 116.8 feet bgs and at GB-1 at 120 feet bgs. The underlying clay is greenish-gray and hard.

Groundwater flow conditions have been detailed in the previously submitted APAR (ERM, 2000) and Revised APAR (ERM, 2004). This APAR Addendum includes groundwater elevation data collected from 2004 through 2009, and is discussed in Section 5.0.

SECTION 2.0 EXPOSURE PATHWAYS AND GROUNDWATER RESOURCE CLASSIFICATION

Section 2.1 Source(s) of Potable Water for On-Site Property and Affected Off-Site Properties

The former wood treatment facility (north of the main rail lines) is abandoned and has no current operating water facilities. Previously, the Site likely received potable water from the City of Houston Public Works Department (the City), as indicated on utility maps acquired from the City with water lines in the area (Figure 3A). The water main enters the Site on the north end near where Liberty Road and Erastus Road intersect. The intermodal yard to the south of the main rail lines received water from the City of Houston. Properties adjacent to the Site also receive water from the City. The source of water for the City of Houston is from a combination of public supply wells and surface water.

No public water supply or surface water bodies are within 0.5 miles of the Site. The Houston-Galveston Coastal Subsidence District requires notification and permits for the drilling of new groundwater supply wells, discouraging the use of private water supply wells in those areas adequately served by the City of Houston municipal water supply system.

Section 2.2 Field Receptor Survey

PBW conducted a field survey at the Site in August 2008. The surrounding properties within a 500-foot radius of the Site consist of residential to the northwest, north, southeast, and south. The UPRR Englewood Yard, commercial/industrial property, is located to the east of the Site. An area of undeveloped land and abandoned houses are located west of the Site.

Section 2.3 Records Survey

As part of the receptor survey, the available records for water wells and water usage in the area were reviewed and updated. A water-well survey was conducted by Banks Information Solutions (BIS) in 2008 to identify water wells within one-half mile of the Site. The survey was completed by searching and reviewing records and maps on file at the Texas Water Development Board (TWDB) and the TCEQ.

Copies of the water well records are provided in Appendix 5.

Section 2.4 Receptor Survey Results

Currently, the 33-acre Site consists of a two main areas bisected by the mainline rails:

1. Former wood preserving works facility north of the rail lines that is now a vacant area used for staging railroad equipment and supplies. The ground surface is covered with packed gravel fill and dirt, with no appreciable topographic gradient; and
2. An active railroad intermodal facility south of the rail main lines covered with concrete and asphalt across a majority of the area, which also has no appreciable topographic gradient.

Several storm drains have been located on the former wood preserving works area; however, it appears that storm water runs off site via overland flow to the City of Houston storm water drains located in Liberty Rd. (north). There are storm water ditches along Wallisville Road on the northeast perimeter of the Site, and along Kashmere on the west side of the Site. In the center of the Site, storm water has a tendency to pond in low topographic areas. Storm water along the southwest perimeter and along the rail lines southwest of the Site drains into a storm water ditch that parallels the rail lines. This storm water ditch is the continuation of the former SDD (SWMU No. 2) that was remediated in 1995 and 1997 (Section 1.2). For the intermodal yard, there are a series of storm drains that convey storm water to the city storm water system.

Through a review of the available water well records within a one-half mile radius of the Site, five industrial water wells were identified within the search radius (Figure 2C). Details of the wells are summarized in Table 2A. One water well (Well ID 1) is located within the Site that is destroyed (plugged and abandoned), and three water wells are located east of the Site (associated with the UPRR Englewood Yard). None of the wells in the Englewood Yard are in use. One water well (Well ID 4) is located south of the Site, and is owned by Houston Power and Light. These industrial water wells are not in use.

The 500-foot radius field survey demonstrated no current potential receptors within the residential neighborhood. No water wells, water tanks, cisterns, or windmills, or surface water bodies were encountered. The nearest surface water body is Buffalo Bayou, located approximately 1.6 miles southwest of the Site. The potential for lateral migration of groundwater from the Site to the southwest

approximately 8,500 feet to Buffalo Bayou is not likely.

Section 2.5 Groundwater Resource Classification

Groundwater classification of the GWBUs at the Site was discussed in the Revised APAR (ERM, 2004). Based on hydraulic testing of zones A-TZ and B-TZ, the two zones were previously classified as Class 2 Groundwater Resources.

Current Use and General Hydrogeologic Context

The uppermost GWBU consists of zones A-TZ, B-TZ, C-TZ, and D-TZ, which are variable in thickness and the ability to produce useable water. As discussed in Section 2.4, five water wells were identified within one-half mile of the Site. However, the wells were completed in deeper zones (greater than 300 feet below ground surface). The City of Houston provides potable water to the site vicinity, and no public water supply wells are within 0.5 mile from the Site. With the implementation of the Harris-Galveston County Subsidence District restrictions on groundwater wells and pumping within the district (Area 2), groundwater use is restricted (HGCSD, 1999). Therefore, there are no potentially threatened groundwater users in this area.

Aquifer Testing

Details of aquifer testing in the A-TZ and B-TZ wells are provided in the Revised APAR (ERM, 2004). In February 2009, PBW conducted aquifer tests on four groundwater monitoring wells that are completed in the clay unit B-CZ to evaluate and determine the groundwater classification for that unit. The objective of the testing was to evaluate hydraulic conductivity of the unit since DNAPL was detected in the unit (i.e. MW-33B). At monitoring wells MW-33B, MW-35B, MW-49B, and MW-63B, baildown tests were conducted following the procedures outlined in the TCEQ TRRP Groundwater Classification Guidance Document TRRP-8 (TCEQ, 2003). The objective of the tests was to determine if the wells were capable of producing a yield of 150 gallons per day (gpd).

Each of the B-CZ wells that were tested is fully penetrating and constructed with 2-inch PVC casing and screen. The tests were conducted by bailing down the wells until each well became dry. Then, using a water level probe, the water level recovery was recorded until the well recovered to approximately 90 percent of the initial water level, or if recovery took longer than 24 hours, the test was stopped. Test data were graphed and analyzed using the TCEQ Well Yield by Cyclic Discharge (Method 2a) in accordance

with the TCEQ Groundwater Classification Guidance Document TRRP-8 (TCEQ, 2003). Details of the well yield tests and graphs showing the recovery over time for the wells are provided in Appendix 7. Of the four wells tested, only MW-35B recovered to 90 percent of the initial height of the static water level in the well within 24 hours. MW-35B was estimated to yield approximately 480 gallons per day, with the well recovering to 90 percent within approximately 15 minutes. Monitoring wells MW-33B, MW-49B, and MW-63B did not recover within 24 hours after being bailed dry. Well yield tests were not conducted three times in these wells since it took over 24 hours for the wells to recover to 90 percent. With the slow recharge based on these well yield tests, the B-CZ is characteristic of a Class 3 groundwater resource. Additional testing will be conducted to evaluate if the B-CZ where MW-33B, MW-49B, and MW-63B are installed is considered saturated soil.

With the exception of MW-35B, the tests indicated that the other three wells would not produce greater than 150 gpd using the well yield by cyclic discharge. Therefore, the eastern portion of the B-CZ has been classified as a Class 3 groundwater resource.

Natural Water Quality

As detailed in the Revised APAR (ERM, 2004), TDS values for the A-TZ, B-TZ, and C-TZ zones ranged from 294 mg/L to 1,566 mg/L.

Section 2.6 Exposure Pathways

There are no changes proposed in this APAR Addendum to the exposure pathways discussed in the Revised APAR (ERM, 2004). COCs have been detected in surface soil, subsurface soil, and groundwater at the Site, and based on the facility operations and analytical results from previous investigations, human health exposure pathways were the only pathways considered complete for the Site. The Site passed the Tier 1 Ecological Exclusion Checklists (APAR, 2000 and Revised APAR, 2004); however, an Expedited Stream Evaluation (ESE) was conducted for the drainage ditch southwest of SDD (SWMU No. 2). Details of the ESE and potential for ecological exposure are provided in Section 9.0.

Therefore, consistent with the Revised APAR the following exposure pathways were evaluated at the Site:

On Site (Commercial/Industrial Land Use)

- $^{Tot}Soil_{Comb}$
- $^{Air}Soil_{Inh\text{-}V}$
- $^{GW}Soil_{Ing}$
- $^{Air}GW_{Inh\text{-}V}$
- $^{GW}GW_{Ing}$

Off Site (Residential Land Use)

- $^{Tot}Soil_{Comb}$
- $^{Air}Soil_{Inh\text{-}V}$
- $^{GW}Soil_{Ing}$
- $^{Air}GW_{Inh\text{-}V}$
- $^{GW}GW_{Ing}$

Exposure pathways ^{SW}GW, ^{Sed}GW, and $^{SW}SW/^{Sed}Sed$ are not considered currently complete because there are no surface water bodies within 0.25-mile of the Site, and the potential for groundwater discharge from the Site to surface water is unlikely. The groundwater pathway $^{GW}GW_{Ing}$ is also not considered complete since exposure to groundwater is not likely with no groundwater wells in the area and the City of Houston providing potable water for the properties in the area. However, the groundwater pathway was evaluated to determine the extent of the Affected Property at the Site.

SECTION 3.0 ASSESSMENT STRATEGY

Section 3.1 General Assessment Issues

Environmental Media Assessed

The conceptual model developed for the Site assumes that the releases of COCs at the Site occurred through spills and discharges during the creosote-treating operations from 1911 to 1984. Based on these assumptions, the primary media identified for assessment included surface soils, subsurface soils, and groundwater. Since no surface water bodies are located in the vicinity of the Site, surface water was assumed to not be a potentially impacted media and therefore was not assessed.

This APAR Addendum focuses on data collected after submittal of the Revised APAR in 2004. Soil data collected prior to 2004 were incorporated into the assessment of environmental media. However, groundwater data from the July 2008 CPT/ROST and hydropunch investigation and February 2009 groundwater sampling event were the only data used for assessment of the Affected Property and determining the PCL Exceedance (PCLE) Zone for groundwater. Data collected from piezometers TW-01, TW-02, and TW-03 in 2007 were used in the evaluation of COCs for the Site.

Target COCs

Details of target COCs and development of the site-specific COCs were established in the RFI Work Plan (IC, 1994), as discussed in the Revised APAR (ERM, 2004). A summary of the site-specific COCs is provided on Table 3B. Soil and groundwater media collected from 2004 through 2009 were sampled for the site-specific COCs. In addition to the site-specific target COCs, groundwater samples collected from piezometers TW-01, TW-02, and TW-03 were analyzed for the target constituent list (TCL) for the following methods:

- Volatile Organic Compounds (VOCs) by EPA Method 8260; and
- Semi-Volatile Organic Compounds (SVOCs) by EPA Method 8270.

To address TCEQ comments dated October 8, 2004 on the Revised APAR, two soil samples were analyzed for chlorinated dibenzodioxons (CDDs) and chlorinated dibenzofurans (CDFs) to evaluate these impurities typically found in commercial-grade pentachlorophenol (PCP). Details of the CDD/CDF results are provided in Section 4.0.

Background

No background samples have been collected at this Site.

Section 3.2 Assessment Strategy

General Assessment Approach

The general assessment approach was to assess the surface soil, subsurface soil, and groundwater at the Site by evaluating and delineating COC concentrations in these media. This APAR Addendum includes data collected after submittal of the Revised APAR from 2004 through 2009. The objective of the subsequent investigations was to evaluate and delineate site-specific COCs in the affected media to TCEQ TRRP requirements. Details on the sampling approach are discussed in the following section.

Sampling Approach

Soil and groundwater samples were collected using various sampling techniques. Undisturbed soil samples were collected using direct-push, hollow-stem auger, hand-auger methods, and sonic drilling methods. Soil lithology was also described using CPT methods (tip resistance/sleeve friction ratio) with ROST testing.

Soil samples collected from each soil boring were generally screened in the field using an organic vapor meter (OVM). Generally, a soil sample was collected for laboratory testing from the surface soils (0 to 5 feet assuming commercial/industrial land use), and in some soil borings, a second sample was collected of the subsurface soils for laboratory testing between the surface soils (>5 feet) and the top of the saturated unit or uppermost GWBU. Soil samples were typically collected where elevated OVM headspace readings were noted in the surface soils and subsurface soils.

Recent groundwater samples were collected at the Site using micro-purge or low-flow sampling methods. Prior to sampling the monitoring wells, the depth to groundwater and non-aqueous phase liquids (NAPLs) were measured using an oil-water interface probe.

Utilities

There are two main areas of underground utilities located at the Site: on-site underground utilities (storm water drains, fiber-optic lines, and municipal utilities cutting across the Site), and off-site municipal

utilities that border the Site. The underground utilities encountered on site and in the vicinity of the Site are summarized on Table 3A and discussed below.

On-Site Utilities

Storm water leaves the Site via storm water ditches on the west and east side of the Site, and into the City of Houston storm water system to the north of the Site on Liberty Road. Water and gas lines enter the Site from Liberty Road. The water line is currently shut off at the valve near Liberty Road, and the gas line is capped off within the Site near Liberty Road. Two sets of fiber optic lines, Level 3 Communications and Qwest, run along the north side of the rail main lines across the entire length of the Site (Figure 3A). Based on conversations with both Level 3 Communications and Qwest representatives, the fiber lines run underneath SWMU Nos. 2, 5, 4, 8, and 10/11. The fiber lines run directly underneath the drainage ditch southwest of the Site and under the SDD about 3 to 5 feet bgs. The Level 3 Communications line reportedly was directionally bored to a depth of 40 to 45 feet bgs underneath the Original and Recent Process Areas (SWMU Nos. 5 and 4, respectively) and under the AST Area (SWMU No. 8). The Qwest fiber line reportedly runs 10 to 15 feet northwest of the main rail line, and is about 5 to 10 feet bgs through the Site. Just east of SWMU No. 8, the both fiber lines return to approximately 4 to 6 feet below grade an continue running northeast parallel to the rail main line.

In addition to the fiber lines, three City of Houston utilities cut across the Site oriented north-south just west of the Lockwood Road bridge: 1) 60-in wastewater line, 2) 84-in water line, and 3) a 42-in storm sewer line (Figure 3A). Through a review of the utility drawing files obtained from the City of Houston Public Works Survey Department, two of the underground utility lines appear to be at depths that potentially intersect the uppermost GWBU A-TZ. The estimated depths of the utilities based on the city drawings are shown on the Geologic Cross Sections A-A', B-B', and C-C' (Figure 4C-1). The estimated base depth of the 60-in wastewater line and the 84-in water line where Cross Section B-B' crosses the utility lines is approximately 23 feet bgs (approximate elevation of 26 feet HVD). It is highly unlikely that A-TZ groundwater is seeping into the 84-in water line, given the line is under pressure (flow is south to north), constructed with welded steel pipe, and is relatively new (constructed in 2000). However, there is a potential for groundwater from the A-TZ to be seeping into the 60-in wastewater line shown on Figure 3A.

Off-Site Utilities

Water, waste water, storm water, and gas utility lines are located underground in the City of Houston right-of-way (ROW) under Liberty Road along the north perimeter of the Site (Figure 3A). A water line runs underground under Kashmere Street northwest of the Site, and water, wastewater, and storm water utility lines cut across the east end of the Site, as detailed in the previous section. In February 2008, PBW conducted a survey of the storm water drains along Liberty Road using an organic vapor meter (OVM) and photo-ionization detector (PID) to evaluate organic vapors and lower explosive limit (LEL) readings from the drains. As shown on Figure 3A, there were no OVM or LEL readings above background readings in any of the storm drains tested.

Assessment Methods

This APAR Addendum addresses additional site investigations conducted since the Revised APAR was submitted to the TCEQ in 2004. These site investigations have included multiple soil and groundwater sampling events that were conducted in 2006 through 2009. The assessment methods used in the investigations are discussed below.

2006 Additional Site Investigation. To address TCEQ comments on the Revised ARAR, ERM conducted a soil and groundwater investigation from May through August 2006. The objective of the additional investigation was to delineate site-specific COCs in the environmental media to TCEQ TRRP Residential Assessment Levels (RALs). The list of site-specific COCs is provided on Table 3B. The following locations were drilled, sampled, or monitoring wells were installed (locations shown on Figure 1A):

- *Soil Sampling* – ERM collected surface soil samples from three soil borings on site (SB-56, SB-57, and SB-99), four soil borings north of the Site along Liberty Road (SB-59 through SB-62), six soil borings (SB-79 through SB-84) in and around the Former Inactive Wastewater Lagoon (AOC No. 6), fourteen soil borings (SB-86A through SB-96B) along the SDD (SWMU No. 2), and from eleven replacement soil borings to evaluate pentachlorophenol in surface soils (to address TCEQ Comment No. 18 from the April 15, 2005 TCEQ letter (TCEQ, 2005)). The soil borings drilled along the SDD were dug with hand augers to evaluate the extent of the former wood line ditch. Soil samples were collected from some of the soil borings. Subsurface soil samples were collected from two locations, SB-73 and SB-74. In addition, ERM collected soil samples from

the saturated A-TZ zone and from the aquitard B-CZ zone. Soil samples were collected using direct-push technology (DPT) drilling methods.

- *Monitoring Well Installation* – During the investigation, ERM installed two double-cased C-TZ wells MW-53C and MW-54C off site using mud-rotary drilling methods.

2007 Additional Soil and Groundwater Investigation. PBW continued the investigation activities initiated by ERM in 2006 by conducting a soil and groundwater investigation using hollow-stem auger (HSA) drilling methods, direct-push drilling methods, mud-rotary drilling methods, and hand-auger sampling methods to collect soil samples and install groundwater monitoring wells at the Site. The objective of the additional investigation was to delineate COCs in the environmental media to TCEQ RALs. The following locations were drilled, sampled, or monitoring wells were installed (locations shown on Figure 1A):

- *Soil Sampling* – Soil samples were collected from two locations to approximately four feet below ground surface at TW-01(2-4) (within the Original Process Area (SWMU No. 5)) and MW-52A(2-4) (within the Recent Process Area (SWMU No. 4)) to evaluate the source areas for impacts of chlorinated dibenzodioxins (CDDs) and chlorinated dibenzofurans (CDFs) per the TCEQ comment letter dated November 19, 2004. Soil borings SB-100 through SB-107 were conducted at locations within the storm water drainage ditch southwest of the South Drainage Ditch (SWMU No. 2) and around the Former Inactive Wastewater Lagoon (SWMU No. 6). Soil samples from these borings were collected at 0-0.5 and 1.5-2 feet bgs.

- *Monitoring Well Installation/Development* – During the investigation, eight A-TZ wells were installed (MW-35A, MW-36A, MW-38A, MW-44A, MW-49A, MW-50A, MW-51A, and MW-52A), two double-cased B-CZ wells were installed (MW-33B and MW-35B), and one triple-cased C-TZ well was installed (MW-47C). After each monitoring well was installed, the wells were developed to remove sediment from the wells.

- *Temporary Piezometers/Hydropunch GW Sampling* - Using DPT, three piezometers were installed in the A-TZ to evaluate potential light non-aqueous phase liquids (LNAPLs): TW-01 (within the Original Process Area (SWMU No. 5)), TW-02 (within the Aboveground Storage Area (SWMU No. 8)), and TW-03 (in the intermodal yard near the former waste water lagoon

south of the rail main lines). Soil samples and groundwater samples collected from piezometers TW-01, TW-02, and TW-03 were analyzed for the TCL for VOCs by EPA Method 8260 and SVOCs by EPA Method 8270C. The objective of the analyses was to evaluate if other COCs not included in the site-specific COC list were present in groundwater at the former source areas.

Soil samples were analyzed for site-specific COCs to evaluate the Affected Property, except for selected soil samples that were analyzed for a subset of specific COCs to evaluate the lateral extent of those COCs in soils.

Each soil sample was placed in a laboratory-supplied container, preserved as appropriate, immediately placed on ice and delivered to STL in Houston, Texas for analysis. The samples were analyzed in accordance with EPA protocol for the analytical methods requested. Chain-of-custody procedures were maintained from the field through the reporting of laboratory results. Field quality assurance/quality control (QA/QC) samples (i.e., field duplicates, equipment blanks) were also collected.

After each soil boring was drilled to the target depth, the boring was backfilled with granular bentonite or bentonite pellets. Each soil boring was surveyed in the field with the differential global positioning satellite (GPS) meter. Permanent monitoring wells were surveyed by a licensed, professional surveyor to Texas State Plane coordinates (NAD 27, Texas South Central, U.S. Feet).

DNAPL Recovery Testing and Underground Utility Assessment – February 2008. PBW conducted DNAPL recovery tests on selected wells (MW-12B, MW-16, MW-32A, MW-41B, MW-45C), collected DNAPL samples from wells MW-32A and MW-41B, and conducted an assessment of the underground utilities around the Site by collecting field measurements from storm sewer intakes in the City of Houston ROWs.

At each well tested for DNAPL recovery, the initial product thickness was measured and tubing was placed in the well to near the total depth. The well was then pumped with either a peristaltic or diaphragm pump until DNAPL was no longer measured in the well or the fluids removed were mostly water. The pump was then turned off and DNAPL thickness measurements were collected.

During the DNAPL removal at MW-32A and MW-42B, samples of the DNAPL were collected for Fluid Properties analysis by ASTM D1481, D445, and D971. Samples were delivered to Test America, Houston on February 22, 2008.

OVM and LEL readings were collected at eight storm sewer locations along Kashmere Street and Liberty Road. At each location a photo was taken then a length of tubing was placed into the utility a distance of approximately eight inches. PID and LEL meters were connected to the tubing and allowed time to stabilize before readings were recorded.

CPT/ROST-Hydropunch Investigation – July-August 2008. PBW conducted a CPT/ROST investigation to evaluate the lateral extent of DNAPL in the A-TZ and B-CZ on and off site, and to collect reconnaissance hydropunch groundwater samples from the A-TZ, B-TZ/B-CZ, and C-TZ zones to evaluate the horizontal extent of COCs in groundwater. Sixteen CPT/ROST borings (CPT-36R-08, CPT-40R-08 through CPT-46R-08, CPT-48R-08 through CPT-54R-08, and CPT-56R-08) were conducted, and reconnaissance groundwater (hydropunch) samples were collected from five of the locations (CPT-49R-08 (B-TZ), CPT-50R-08 (B-TZ), CPT-51R-08 (B-TZ), CPT-54R-08 (C-TZ), and CPT-56R-08 (A-TZ)). Groundwater samples were collected using small-diameter tubing and foot valve inside a hydropunch assembly and analyzed for site-specific COCs (VOCs by EPA Method 8260 and SVOCs by EPA Method 8270C).

Groundwater samples were placed in a laboratory-supplied container, preserved as appropriate, and immediately placed on ice. Groundwater samples were delivered to TestAmerica Laboratory in Houston, Texas for analysis. The samples were analyzed in accordance with EPA protocol for the analytical methods requested. Chain-of-custody procedures were maintained from the field through the reporting of laboratory results.

Each CPT/ROST boring was surveyed in the field with the differential GPS meter. Each CPT/ROST boring and Hydropunch location was plugged with granular bentonite or bentonite chips from the bottom of the hole to ground surface.

2009 Additional Soil and Groundwater Investigation. In January 2009, PBW conducted a supplemental soil and groundwater investigation at the Site to further evaluate the lateral and vertical extent of COCs above TRRP PCLs in groundwater, and to evaluate the lateral extent of COCs above TRRP PCLs in soils. The following locations were sampled or monitoring wells were installed (locations shown on Figure 1A):

- *Soil Sampling* – Soil samples were collected from soil borings SB-108 through SB-117 at locations within the storm water drainage ditch southwest of the SDD (SWMU No. 2) and around the Former Inactive Wastewater Lagoon (AOC No. 6) to evaluate COCs in surface soils. Soil samples from these borings were collected at 0-0.5 and 0.5-2 feet bgs. Soil borings were also conducted along the northern perimeter of the Site at borings SB-118 through SB-125 (including soil samples collected from installation of monitoring wells MW-57A and MW-58A), and along the east and southern perimeter of the intermodal yard at soil borings SB-126 through SB-137. Soil samples from the ten soil borings north of the former operations and the 12 soil borings around the east and south perimeter of the intermodal yard were collected to evaluate horizontal extent of site-specific COCs in surface soils. Soil samples were selected from each boring based on field screening OVM readings and/or visual observations.

- *Monitoring Well Installation/Development* – During the investigation, the following monitoring wells were installed:
    - Seven A-TZ wells were installed using a mini-sonic rig: MW-59A, MW-60A, MW-61A southeast (downgradient) of MW-49A and MW-18A; MW-57A and MW-58A in SWMU No. 8 to evaluate the lateral extent of LNAPLs towards Liberty Road; TW-56A to evaluate recoverability of the LNAPL in SWMU No. 8; MW-65A west of AOC 6; and replacement A-TZ well MW-24AR for MW-24A;
    - One BTZ well MW-63B was installed by sonic drilling techniques to evaluate dissolved COC concentrations near MW-35B; and a 4-inch B-TZ well, TW-41B, was installed near MW-41B to evaluate DNAPL recoverability; and
    - One pilot hole (GB-1) was drilled using sonic drilling techniques to the D-TZ (135 feet bgs) and the hole was continuously logged to evaluate the lithology and identify the D-TZ. After identifying the D-TZ zone, three monitoring wells, MW-59D, MW-65D, and MW-66D were installed in the D-TZ using sonic drilling techniques that included setting isolation casings across the A-TZ and C-TZ zones (B-TZ not present on east portion of the property).

After each monitoring well was installed, the wells were developed to remove sediment from the wells. Permanent monitoring wells were surveyed by a licensed, professional surveyor to Texas State Plane coordinates (NAD 27, Texas South Central, U.S. Feet).

Groundwater Monitoring Events – 2007 through 2009. Not including the semi-annual groundwater sampling conducted at the Closed Surface Impoundment (SWMU No. 1) as part of the RCRA Compliance Permit for the Site, site-wide groundwater monitoring events were conducted to evaluate COC trends in groundwater at the Site. Site-wide events were conducted in the following months (number of wells sampled):

- March 2007 (61 wells);
- January 2008 (60 wells);
- July 2008 (40 wells); and
- February 2009 (54 wells).

In March 2007, all of the monitoring wells installed at the Site except the SWMU No. 1 wells were sampled to evaluate the groundwater conditions across the Site. The subsequent site-wide events included selected wells (perimeter, off-site, and selected source area wells). Groundwater samples were collected using low-flow sampling techniques described in the EPA guidance document Low-Flow (Minimal Drawdown) Ground Water Sampling Procedures (EPA, 1995). Each sample was analyzed for the site-specific COC list (VOCs by EPA Method 8260 and SVOCs by EPA Method 8270C).

Prior to sampling, the depth to water and the thickness or presence of NAPL was measured using an oil-water interface probe. For wells with DNAPL, water samples were collected at least 5 to 10 feet above the top of the measured DNAPL. Purging was accomplished in such a way as to minimize disturbance of sediments at the bottom of the well, and therefore minimize turbidity of the water samples. This was accomplished by purging at a low flow rate with the pump intake near the base of the screened interval, unless DNAPL was present and then the pump intake was placed no closer than five feet to the DNAPL surface. A peristaltic pump with dedicated tubing was used during the purging and sampling of each well. Since dedicated tubing was used in each well, no equipment rinse sample was collected.

Well purging was accomplished by purging at low-flow rates while monitoring the following field parameters: specific conductance, pH, temperature, dissolved oxygen, oxidation/reduction potential (redox), and turbidity. Meters were calibrated before sampling each day, using the manufacturer's procedure. Odor and color of the purge water were also noted on the groundwater sampling record. Each monitoring well was purged until the following parameters had stabilized, or until the well purged dry.

After purging, groundwater samples were collected from the discharge of the pump following low-flow

sampling techniques. Sampling information (i.e., sample time, bottle sets, sampler name, use of filter, etc.) was recorded on the groundwater sampling forms (Appendix 3). Groundwater samples were placed in coolers and delivered to TestAmerica Laboratory in Houston, Texas (March 2007, January and July 2008) or ALS Laboratory Group in Houston, Texas (February 2009) for analysis. The samples were analyzed in accordance with EPA protocol for the analytical methods requested.

Data Quality

Based on the investigations from 2006 through 2009, samples collected from the Site were analyzed in accordance with the guidelines of *EPA SW-846, Test Methods for Evaluating Solid Waste-Physical/Chemical Methods*. The procedures for laboratory analysis, with any modifications, are further documented in the laboratory standard operating procedures, which are maintained at the laboratory, and are listed in the laboratory's quality assurance plan. Data obtained from field and laboratory measurements were reviewed for conformance to project requirements, ensuring the lowest method quantitation limit (MQL) was used in the evaluation.

Analytical data from the critical soil and groundwater samples collected since 2006 were reviewed for adherence to established QA/QC criteria, and a Data Usability Summaries (DUSs) were prepared to demonstrate the quality of the laboratory analytical data and present any deviations from the established QA/QC criteria. Details of the DUSs are provided in Appendix 10. For the data collected since 2006 (i.e., data presented in this APAR Addendum), the soil and groundwater data are considered usable for the purpose of evaluating COCs in the environmental media to assess the affected property based on the COCs and establish PCLE zones.

SECTION 4.0 SOIL ASSESSMENT

Section 4.1 Derivation of Assessment Levels

The surface soil and subsurface soil assessment levels were selected based on the current and future land use and potential receptors at the Site. Surface soils were evaluated in the top 5 feet and the subsurface soils were evaluated from 5 feet bgs to the top of the uppermost GWBU, A-TZ Unit. Soil samples that were collected across the five-foot interval (i.e., four to six feet below grade) were conservatively evaluated as surface soils. With the surrounding properties being residential land use, RALs were used to evaluate COCs and establish the Affected Property for both on site and off site.

Based on the evaluation of potentially complete exposure pathways (Table 2C), the following soil-related residential pathways were assessed at the Site:

- $^{Tot}Soil_{Comb}$ (surface soils);
- $^{Air}Soil_{Inh\text{-}V}$ (subsurface soils); and
- $^{GW}Soil_{Ing}$ (Tier 1 and Tier 2) (surface and subsurface soils).

The $^{Tot}Soil_{Comb}$ pathway was evaluated as potentially complete since the Site is partially covered with crushed gravel and soil, and in consideration of potential future construction activities at the Site. Based on the ESE, the ecological pathway was considered incomplete (discussed in Section 9.0).

RALs for potential COCs in the surface and subsurface soils were developed using TCEQ TRRP Tier 1 Residential Soil PCLs dated March 2009, assuming the source area is 30 acres in size, and Tier 2 PCLs were calculated using site-specific data. Details of the Tier 2 PCLs are discussed in Section 11, with calculations, equations, and supporting documentation for Tier 2 ^{GW}Soil PCLs in Appendix 9. RALs were established as the lesser value between $^{Tot}Soil_{Comb}$ and $^{GW}Soil_{Ing}$ (Tier 1 or 2) for surface soils (0 to 5 feet bgs on site and 0 to 15 feet bgs off-site) and the lesser value between $^{Air}Soil_{Inh\text{-}V}$ and $^{GW}Soil_{Ing}$ (Tiers 1 or 2) for subsurface soils (>5 feet bgs on site and >15 feet bgs off site). For the subsurface soil PCL evaluation, only soil samples collected below the surface soils (i.e. deeper than 5 feet or 15 feet bgs) and above the saturated uppermost GWBU (A-TZ) were used in accordance with the TRRP definition for subsurface soils (30 TAC §350.4(a)(86)). Soil samples collected from the saturated GWBUs or aquitards below those units were not used for evaluating the subsurface soil Affected Property or PCLE Zone.

Details of the nature and extent of the COCs in soil are discussed in the following sections.

Section 4.2 Nature and Extent of COCs and NAPL in Soil

This APAR Addendum incorporates the soil data collected since 2004 with data collected as part of the original APAR (ERM, 2000) and Revised APAR (ERM, 2004) into the assessment of the Affected Property. As discussed in Section 3.1, surface and subsurface soils collected at the Site from 1994 through 2009 were sampled and analyzed for the list of 34 site-specific COCs (Table 3B). However, in addition to the site-specific COCs, two soil samples (TW-01 (2-4) and MW-55A (2-4)) from the former process areas (SWMU Nos. 4 and 5) were also analyzed for CDDs and CDFs in response to the TCEQ Comment Letter dated October 8, 2004 (TCEQ, 2004). Soil samples collected during installation of piezometers TW-01, TW-02, and TW-03 were analyzed for the a comprehensive list of VOCs by EPA Method 8260 and SVOCs by EPA Method 8270 to evaluate if other COCs are present in the former process areas.

Of the site-specific COCs and other COCs evaluated, 39 COCs were detected in surface soils and 44 COCs were detected in subsurface soils at concentrations greater than the analytical reporting limits. The list of COCs detected in the surface soil samples are listed on Table 4A and the COCs detected in the subsurface soils are presented on Table 4C. A summary of soil analytical data are presented on the following tables:

Table	Description
4D-1	Summary of Surface Soil Sampling Results

4D-6	Summary of Soil Sampling Results – CDDs and CDFs

Comparing the maximum concentrations detected in surface and subsurface soils to RALs (lowest PCL between $^{Tot}Soil_{Comb}$ and $^{GW}Soil_{Ing}$ (Tier 1 and 2)), concentrations of the following COCs that were not screened out (see Section 10.0 for details) exceeded their respective RALs in the surface and subsurface soils (with figure presenting spatial distribution of the COCs exceeding RALs for each COC):

Surface Soils
- 1,2-Diphenylhydrazine (Figure 4A-1)

Subsurface Soils
- 2,4-Dimethylphenol (Figure 4B-1)

Surface Soils

- 2,4-Dinitrotoluene (Figure 4A-2)
- 2-Methylnaphthalene (Figure 4A-3)
- Benzene (Figure 4A-4)
- Benzo(a)anthracene (Figure 4A-5)
- Benzo(a)pyrene (Figure 4A-6)
- Dibenzofuran (Figure 4A-7)
- Fluoranthene (Figure 4A-8)
- Naphthalene (Figure 4A-9)
- Pentachlorophenol (Figure 4A-10)
- Phenanthrene (Figure 4A-11)

Subsurface Soils

- 2-Methylnaphthalene (Figure 4B-2)
- Benzene (Figure 4B-3)
- Dibenzofuran (Figure 4B-5)
- Naphthalene (Figure 4B-6)
- Pentachlorophenol (Figure 4B-7)

Concentrations shown on the figures that are listed above are based on the highest concentration detected in the media (i.e., if multiple sample collected in the surface soils (0 to 5 feet bgs), the highest concentration was used for the RAL evaluation). Soil cross sections present both the lithology for the Site and the distribution of COC s in the surface and subsurface soils (Figure 11C-1 through 11C-3). Except for benzo(a)anthracene, benzo(a)pyrene, and pentachlorophenol, COCs in surface and subsurface soils were delineated on Site to the appropriate RALs. The extents of the COCs detected in surface and subsurface soils are discussed below.

Surface Soils

Surface soil data collected at the Site are summarized on Tables 4D-1 and 4D-2. The COCs detected above RALs, are detailed below.

1,2-Diphenylhydrazine was detected at concentrations greater than the RAL of 0.23 mg/Kg in 1 of the 148 surface soil samples analyzed (0.7 percent) at the Site. The one surface soil sample exceeding the RAL is located southwest of the SDD (SWMU No. 2) at SB-104(1-2) (1.84 mg/Kg) (Figure 4A-1). Of the 148 samples analyzed, 55 samples (37 percent) had results that were less than the SDL, but the SDL was greater than the RAL. 1,2-Diphenylhydrazine concentrations are laterally delineated to the appropriate RAL in surface soils.

2,4-Dinitrotoluene was detected at concentrations greater than the RAL of 0.022 mg/Kg in 1 of the 115 surface soil samples analyzed (0.9 percent) at the Site. The one surface soil sample exceeding the RAL is located on the east perimeter of the Former Waste Water Lagoon (AOC 6) at SB-82(0-0.5) (0.16 mg/Kg) (Figure 4A-2). Of the 115 samples analyzed, 55 samples (48 percent) had results that were less than the SDL, but the SDL was greater than the RAL. 2,4-Dinitrotoluene concentrations are laterally delineated to the appropriate RAL in surface soils.

2-Methylnaphthalene concentrations were detected in surface soils at concentrations that exceeded the RAL of 126 mg/Kg in 7 of 150 surface soil samples analyzed (5 percent). The seven surface soil samples that define the 2-methylnaphthalene Affected Property are found in the general area of the Original Process Area (SWMU No. 5) and Recent Process Area (SWMU No. 4) (Figure 4A-3). The 2-methylnaphthalene concentrations that exceed the RAL range from 139 mg/Kg at SB-56(4') to 1,300 mg/Kg at SB-07(2.5'). Surrounding surface soil samples indicate 2-methylnephthalene concentrations are delineated to the appropriate RAL (Figure 4A-3).

Benzene concentrations were detected in 6 of the 105 surface samples analyzed (5.7 percent), with only 1 of the 105 surface soil samples analyzed (0.95 percent) with concentrations greater than the RAL of 0.10 mg/Kg at the Site. The one surface soil sample exceeding the RAL is located at the northeast portion of the SDD (SWMU No. 2) at SB-93B(3.5-4) (0.21 mg/Kg) (Figure 4A-4). Benzene concentrations are laterally delineated to the appropriate RAL in surface soils.

Benzo(a)anthracene was detected at concentrations greater than the RAL of 5.6 mg/Kg in 27 of the 160 surface soil samples analyzed (17 percent). Most of the RAL exceedances are in the vicinity of the two former process areas (SWMU Nos. 4 and 5) where eight surface soil samples range from 8.2 mg/Kg at SB-06(4) to 220 mg/Kg at AOC-7(0) (Figure 4A-5). Three soil samples within and near the AST Area (SWMU No. 8) that had concentrations greater than the RAL ranged from 5.9 mg/Kg at SB-124(0.5-2.5) near the Site perimeter to 21.5 mg/Kg at AOC-5E(0). Five surface soil samples exceeding the RAL were located along the SDD (SWMU No. 2), which included samples SB-86A(2-2.5) at 17.6 mg/Kg and SB-104(1-2) at 401 mg/Kg (Figure 4A-5). Two soil samples west of AOC 6 had benzo(a)anthracene concentrations greater than the RAL at SB-84(0-0.5) at 21.6 mg/Kg and SB-108(0-2) at 15.3 mg/Kg. The highest concentration detected at the Site was in SB-104(1-2) at 401 mg/Kg. Benzo(a)anthracene concentrations are laterally delineated to the appropriate RAL in surface soils, with off-site impacts noted adjacent to AOC 6 and potential impacts in the City of Houston ROW for Liberty Road to the north of the Site (Figure 4A-5).

Benzo(a)pyrene was detected in 109 of the 162 surface soil samples analyzed (68 percent), with 79 of those surface soil samples (49 percent) at concentrations greater than the RAL of 0.56 mg/Kg. Most of the surface soil samples that exceeded the RAL are in and near the former process areas (SWMU Nos. 4 and 5), along the northeast portion of the north perimeter of the Site, and along the SDD (SWMU No. 2) and Former Waste Water Lagoon (AOC6) (Figure 4A-6). The distribution of benzo(a)pyrene

concentrations in surface soils suggests spills and releases around the former process areas, and impacts from wastewater discharge into the SDD and into the Former Waste Water Lagoon. The highest concentration detected in surface soil was at MW-31A(0-2) at 70.6 mg/Kg north of the Original Process Area (SWMU No. 5). Benzo(a)pyrene concentrations exceeded the RAL in two samples collected off site: SB-60(0-0.5) at 0.73 mg/Kg and SB-108(0-2) at 23.2 mg/Kg. Concentrations also exceeded the RAL at SB-131(1.5-3.5) at 4.7 mg/Kg located at the southeast corner of the intermodal yard. Benzo(a)pyrene concentrations are delineated to the appropriate RAL in surface soils except along the property boundary north of locations MW-57A, SB-122, SB-123, and near SB-60; and near SB-131 on the southeast corner of the Site (Figure 4A-6). The RAL exceedance at SB-60 may be from anthropogenic sources (i.e., truck emissions, asphalt pavement) with the long history of heavy industrial land use and asphalting of Liberty Road. Also, the benzo(a)pyrene concentration at SB-131 may be a result of sampling bias (i.e, asphalt pavement) since the railroad did not acquire the property until the mid 1980s and it was not incorporated into the intermodal yard until after 1991. No wood preserving activities took place in the vicinity of this location. Additional surface soil sampling in the localized area immediately north of the Site (north of SB-123 and SB-60) will be necessary to evaluate the potential for affected property off site.

Dibenzofuran concentrations were detected in 62 of the 148 surface soils analyzed (42 percent), of which 5 samples exceeded the RAL of 249 mg/Kg (3 percent). These five samples are generally found near the former process areas (SWMU Nos. 4 and 5) (Figure 4A-7), with the highest concentration detected at SB-07(2.5) at 1,100 mg/Kg. Dibenzofuran concentrations are delineated to the appropriate RAL in surface soils.

Fluoranthene concentrations were detected in 114 of the 149 surface soils analyzed (76 percent), of which 2 samples exceeded the RAL of 2,316 mg/Kg (1.3 percent). The two locations that exceed the RAL include SB-07(2.5) at 2,500 mg/Kg, and SB-104(1-2) at 2,990 mg/Kg (Figure 4A-8). Fluoranthene concentrations are delineated to the appropriate RAL in surface soils.

Naphthalene concentrations in surface soils exceeded the RAL of 124 mg/Kg in 11 of the 156 soil samples (7 percent) analyzed, with the total of 77 naphthalene detections (49 percent). The 11 surface soil samples that exceed the RAL are generally in and around the former process areas (SWMU Nos. 4 and 5) (Figure 4A-9). The highest concentration was detected in SB-07(2.5) at 3,900 mg/Kg. Naphthalene concentrations are delineated to the appropriate RAL in surface soils.

Pentachlorophenol was detected in 53 of the 175 samples analyzed (30 percent) with 14 of the samples with detected concentrations greater than the RAL of 0.12 mg/Kg (8 percent). Most of the RAL exceedances are in the vicinity of the two former process areas (SWMU Nos. 4 and 5), near the AST Area (SWMU No. 8), and along a portion of the SDD (SWMU No. 2) (Figure 4A-10). The highest concentration detected in the surface soils was at SB-89B(0-0.5) in the SDD (SWMU No. 2) at 3.13 mg/Kg. Concentrations exceeded the RAL along the north property boundary at SB-52, SB-54, and SB-124. The RAL exceedance at SB-124 in surface soil is laterally delineated to the north with the sample from SB-60(0-0.5) at 0.037 mg/Kg, and concentrations detected in SB-52 and SB-54 are delineated by SB-62, SB-119, and SB-120. Pentachlorophenol concentrations in surface soil appear to be delineated to the appropriate RAL.

Pentachlorophenol concentrations were less than the SDLs in 122 samples (i.e., "U" flagged); however, 64 of these samples had SDLs greater than the RAL. In response to the TCEQ comment letter dated June 9, 2005, UPRR agreed to resample a subset of these locations as specified in the response letter dated September 5, 2006 (ERM, 2006). Eleven locations were resampled (SSO-A02R(0-2'), SSO-AO4R (0-2'), AOC-4SER (0-2'), SS0-F08R(1.5-2'), SSO-B03R(0-2'), SSO-C03R(0-2'), SSO-A06R(0-2'), SSO-C05R(0-2'), SSO-C01R(0-2'), SS0-11R(0-4'), SSO-C06R(0-2')) in 2006 and their respective SDLs were less than the RAL. Of these eleven surface soil samples, four locations did not have pentachlorophenol concentrations detected above the SDL, five samples were detected above the SDL but below the RAL, and two samples had concentrations detected above the SDL and RAL (SSO-11(0-4) at 0.152 mg/Kg and SSO-C06(0-2) at 0.181 mg/Kg). The distribution of the resampled locations indicates that pentachlorophenol concentrations within the Railroad Tie Storage Area (SWMU No. 12) are less than the RAL (Figure 4A-10).

Phenanthrene concentrations were detected in 99 of the 149 surface soils analyzed (66 percent), of which 2 samples exceeded the RAL of 1,705 mg/Kg (1.3 percent). Similar to the fluoranthene RAL exceedance distribution, the two locations that exceed the RAL include SB-07(2.5) at 4,100 mg/Kg, and SB-104(1-2) at 3,340 mg/Kg (Figure 4A-11). Phenanthrene concentrations are delineated to the appropriate RAL in surface soils.

Subsurface Soils

As discussed previously, the subsurface soil RAL evaluation was limited to the soil data collected between the surface soils and the top of the GWBU. The list of subsurface soil samples and results are provided on Tables 4D-3 and 4D-4. Details of the subsurface soil COC evaluation are discussed below.

2,4-Dimethylphenol was sampled in 19 subsurface soil samples with only one sample (5 percent), SB-08(18) at 25 mg/Kg, had a detection above the RAL of 17.65 mg/Kg (Figure 4B-1). None of the other subsurface soil samples had concentrations above the SDL for 2,4-dimethylphenol.

2-Methylnaphthalene concentrations were detected 10 of the 21 subsurface samples analyzed, with 4 of those samples (19 percent) with concentrations exceeding the RAL of 126 mg/Kg. The four subsurface soil locations that exceeded the RAL consist of SB-74(14') at 213 mg/Kg, SB-08(14) at 360 mg/Kg, SB-08(18) at 400 mg/Kg, and SB-07(19) at 1,700 mg/Kg. These four locations are located within the Original Process Area (SWMU No. 5) (Figure 4B-2). Surrounding subsurface soil samples indicate 2-methylnephthalene concentrations are delineated to the appropriate RAL. To supplement the subsurface data, the Affected Property boundary for 2-methylnaphthalene in surface soil was used to define the Affect Property in subsurface soils. The boundaries used are based on the assumption that the COCs in subsurface soils do not extend a significant distance laterally beyond what was observed in the surface soils. Also, the subsurface soil data supports the data in the surface soil.

Benzene concentrations in subsurface soils exceeded the subsurface RAL of 0.105 mg/Kg in 2 of the 21 samples analyzed (10 percent). The two locations consisted of SB-07(19) at 0.23 mg/Kg and SB-08(18) at 1.1 mg/Kg (Figure 4B-3). Surrounding subsurface soil samples indicate benzene concentrations are delineated to the appropriate RAL.

Dibenzofuran was evaluated in 19 subsurface soil samples, where 10 of the samples had detections above the MDL (53 percent). Two subsurface soil samples, SB-07(19) and SB-08(18) had concentrations above the subsurface RAL of 249 mg/Kg at 360 mg/Kg and 270 mg/kg, respectively (Figure 4B-5). Surrounding subsurface soil samples indicate dibenzofuran concentrations are delineated to the appropriate RAL. However, with the surface soil and subsurface soil RAL for dibenzofuran the same (249 mg/Kg), the dibenzofuran Affected Property in the subsurface was conservatively extended out the same distance and area as the Affected Property for the surface soil except for areas where the data suggest concentrations are less than the RAL.

Naphthalene was detected above the SDL in 14 of the 21 samples analyzed. Of those samples, naphthalene concentrations in subsurface soils exceeded the RAL of 137 mg/Kg in four subsurface samples collected at the Site (19 percent), which included subsurface soil samples SB-07(19) at 7,600 mg/Kg, SB-8(14) at 4,600, SB-8(19) at 17,000 mg/Kg, and SB-74(14) at 2,530 mg/Kg (Figure 4B-6).

The distribution of subsurface soil samples exceeding the RAL is located near the Original Process Area (SWMU No. 5). Similar to the dibenzofuran evaluation, the subsurface soil naphthalene Affected Property was established using the available subsurface soil data, as well as the extent of the surface Affected Property, as shown on Figure 4B-6. Based on subsurface soil samples collected and extrapolating the surface soil data, naphthalene concentrations are delineated to the appropriate RAL in subsurface soils.

Pentachlorophenol was detected above the subsurface RAL in only one sample, SB-95B (5-5.5') at 0.25 mg/kg (Figure 4B-7). Of the 14 subsurface samples analyzed, 8 of the on-site subsurface soil samples had SDLs that were greater than the RAL. As with other COCs in subsurface soils, the surface soil Affected Property for the pentachlorophenol surface soils were extrapolated to subsurface soils. However, as noted in the groundwater section (Section 5.0) and shown on Figure 5B-1, none of the A-TZ wells had pentachlorophenol concentrations detected greater than the PCL. This indicates that even though surface and subsurface soils have pentachlorophenol concentrations greater than the $^{GW}Soil_{Ing}$ pathway, the concentrations are protective of groundwater given the length of time since the releases at the Site (prior to 1984 when the facility shut down) and that no concentrations were detected in groundwater above the PCL.

One of the main COCs detected in surface soils was benzo(a)pyrene. Of the 19 subsurface soil samples analyzed for benzo(a)pyrene, only 6 samples had detections greater than the SDL, and none of those were greater than the subsurface soil RAL of 57 mg/Kg (Figure 4B-4). One sample, SB-08(14), had an elevated MDL (330 mg/Kg) greater than the subsurface soil RAL, and the results were not detected above that SDL. Surrounding subsurface soil samples indicate benzo(a)pyrene concentrations are delineated to the appropriate RAL.

Since benzo(a)pyrene has a relatively high octanol-water partition coefficient (i.e., approximately 2 times that of naphthalene), this COC prefers to partition into the shallow soils rather than migrate vertically. With the occurrence of benzo(a)pyrene in the surface soils relatively wide spread across the Site, the results of the subsurface soil samples less than the RAL supports the predicted fate and transport of this COC in soils.

CDDs/CDFs

In response to the TCEQ comment letter dated October 8, 2004, two soil samples near the former process areas were collected and analyzed for CDDs and CDFs. 2,3,7,8-Tetrachlorodibenzodioxin (2,3,7,8-

TCDD) is considered the most potent congener of the CDD and CDF families of compounds (Palmer, 1988). The TCEQ Residential PCL $^{Tot}Soil_{Comb}$ for 2,3,7,8-TCDD is 0.001 mg/Kg, and the Commercial/Industrial PCL is 0.005 mg/Kg.

The soil samples consisted of TW-01(2-4) collected within the Original Process Area (SWMU No. 5) and MW-52A(2-4) collected within the Recent Process Area (SWMU No. 4), which were analyzed for CDDs and CDFs by EPA Method 8280A. Results of the analysis are provided on Table 4D-6. No CDDs or CDFs were detected above the SDL in sample TW-01(2-4); however, the 2,3,7,8-TCDD SDL (1.2 ng/g (0.0012 mg/Kg)) was slightly greater than the residential PCL (0.001 mg/Kg), but less than the Commercial/Industrial PCL (0.005 mg/Kg). Two CDDs and two CDFs were detected above SDLs in the MW-52A(2-4) sample:

- CDDs: 1,2,3,4,6,7,8-Heptachlorodibenzodioxin (1,2,3,4,6,7,8-HpCDD) at 0.014 mg/Kg (Total HpCDD at 0.033 mg/Kg) and Octachlorodibenzodioxin (OCDD) at 0.280 mg/Kg.
- CDFs: Total Heptachlorodibenzofuran (HpCDF) at 12 ng/g and octachlorodibenzofuran (OCDF) at 0.016J mg/Kg.

No PCLs have been established for the other CDDs or CDFs. However, toxic equivalency factors (TEFs)[1] have been established by the EPA for CDDs and CDFs (EPA, 1987) relative to 2,3,7,8-TCDD. The TEF for 1,2,3,4,6,7,8-HpCDD is 0.01 and 1,2,3,4,7,8,9-HpCDF is 0.01. No TEFs were established by the EPA for OCDD or OCDF. The toxicity for the other CDDs and CDFs were then evaluated by multiplying the detected concentrations to the TEFs for each congener, summing the results, and comparing the result to the 2,3,7,8-TCDD PCLs. The summed result was 0.00014 mg/Kg, below the equivalent PCL of 0.001 mg/Kg. Therefore, the detected results do not present an unacceptable risk.

NAPL Evaluation

Since 1995, site investigations have included activities to evaluate surface and subsurface soils for the presence of NAPL. Specifically, CPT/ROST investigations were conducted in 1995, 2001, and 2008 at the Site using laser-induced fluorescence (LIF) as a tool to identify the presence of NAPL. A total of 75 CPT/ROST locations have been drilled at and around the Site (Figure 1A). Copies of the CPT/ROST logs since 2006 are provided in Appendix 2, and where CPT/ROST borings intersect the geologic cross section lines (Figures 4C-1 through 4C-4), the ROST profiles were posted on the cross sections.

[1] Van den Berg, M., and others. 2006.

ROST/LIF method is used as qualitative screening data only to evaluate the *in situ* distribution of petroleum hydrocarbon NAPL based on the fluorescence response induced in the PAH compounds, which are commonly found in creosote. ROST/LIF results do not conclusively indicate NAPL is present at the Site given the qualitative nature of the screening tool. However, NAPL has been detected soil borings drilled at the Site in areas where elevated ROST responses were observed, and also NAPL has been detected in monitoring wells completed in the A-TZ, B-TZ, B-CZ, and C-TZ zones. Most of the areas with elevated ROST/LIF readings have been in around the former process areas (SWMU Nos. 4 and 5), and around the AST Area (SWMU No. 8). A more detailed discussion of NAPL occurrence in the groundwater-bearing zone is provided in Section 5.2.

TABLE 4A

SURFACE SOIL RESIDENTIAL ASSESSMENT LEVELS WITH NO ECOLOGICAL COMPONENT
UPRR HOUSTON WOOD PRESERVING WORKS

COC	Source area size (acres)	$^{Tot}Soil_{comb}$ PCL[(1)] (mg/kg)	$^{GW}Soil_{Ing}$ PCL[(2)] (mg/kg)	Tier	Residential Assesment Level (mg/l)	exposure pathway	MQL (mg/kg)	Maximum Surface Soil Concentration Sample ID	Depth (feet bgs)	Sample Date	Concentration (mg/kg)	Notes
Pyrene	30	1697.6145	8363.9546	2	1697.614513	$^{Tot}Soil_{Comb}$	0.00667	SB-104(1-2)	1-2	3/15/2007	1610	
Toluene	30	5619.3228	43.184584	2	43.18458418	$^{GW}Soil_{Ing}$		HWPW-MW18-S00	1	2/26/1997	1.4	
Xylenes (tot)	30	753.21563	732.0359	2	732.0358961	$^{GW}Soil_{Ing}$		HWPW-MW18-S00	1	2/26/1997	42	

Explanations

1) $^{Tot}Soil_{Comb}$ PCL = TRRP Tier 1 Protective Concentration Level for total soil combined pathway (30 acre source area).

2) $^{GW}Soil_{Ing}$ PCL = TRRP Tier 1 Protective Concentration Level for soil to Class 2 groundwater ingestion pathway (30 acre source area).

Notes

1) Residential land use assumed to provide most conservative TRRP PCLs.

2) Only COCs having at least one detection and/or a non-detection with a MQL greater than the RAL are included in this table.

3) U = not detected above SQL

4) bgs = below ground surface

Explanations

1) $^{Air}Soil_{Inh-V}$ PCL = TRRP Tier 1 Protective Concentration Level for inhalation of constituents volatilized from soil pathway (30 acre source area).

2) $^{GW}Soil_{Class\ 3}$ PCL = TRRP Tier 1 Protective Concentration Level for soil to Class 3 groundwater ingestion pathway (30 acre source area).

Notes

1) Residential land use assumed to provide most conservative TRRP PCLs.

2) Only COCs having at least one detection and/or a non-detection with a SQL greater than the RAL are included in this table.

3) U = not detected above SQL

3) J = estimated value. Concentration is between sample quanititation limit and method quantitation limit.

7) bgs = below ground surface

Notes:

1. Sampling locations shown on Figures 4A and 4B.
2. Concentrations > RAL are **bold** type.
3. Concentrations > cPCL are highlighted.
4. Non-detected concentrations > RAL of cPCL are **bold** type.
5. TRRP PCLs (30 TAC §350, Tables 1, 2, and 3), last updated on March 25, 2009.
6. RAL = Residential Assessment Level, C/I = Commercial/Industrial
7. J = Estimated Value, < = Compound not detected at the specified detection limit.

5.0 GROUNDWATER ASSESSMENT

Section 5.1 Derivation of Assessment Levels

The groundwater assessment levels at the Site were selected based on the well yield testing detailed in the Revised APAR (ERM, 2004), and in Section 2.5 of this report. Based on those results, A-TZ, B-TZ, and C-TZ have been classified as a Class 2 GWBU, with the aquitard B-CZ behaving as a Class 3 groundwater resource. No well yield testing has been conducted for the D-TZ unit; however, based on qualitative well yield during the February 2009 sampling event, D-TZ is likely a Class 2 GWBU. Based on the evaluation of potentially complete expose pathways, the following groundwater-related residential pathways were assessed at the Site:

- $^{GW}GW_{Ing}$
- $^{GW}GW_{Class\ 3}$ (for selected B-CZ wells) and
- $^{Air}GW_{Inh\text{-}V}$.

The July 2008 CPT/ROST Hydropunch and January/February 2009 groundwater analytical data from the Site were initially compared to the TCEQ TRRP Residential Groundwater PCLs dated March 2009, assuming the source area is greater than 0.5 acres (30-acre size), to evaluate target COCs that exceeded the groundwater RALs. RALs were established as the lesser value between Residential $^{GW}GW_{Ing}$ (or $^{GW}GW_{Class3}$)and $^{Air}GW_{Inh\text{-}V}$ PCLs.

As discussed in Section 2.0, there are no water bodies within 0.5 miles of the Site. The closest water body is Buffalo Bayou, which is located about 1.6 miles southwest of the Site. Therefore, the surface water pathway as a function of groundwater-to-surface water evaluation (^{SW}GW PCLs) and the sediment pathway as a function of groundwater-to-sediment evaluation (^{Sed}GW PCLs) were considered incomplete for the purposes of this affected property assessment.

The Affected Property was established based on groundwater COC results using the most recent groundwater analytical data (January/February 2009). Details of the nature and extent of the COCs in groundwater as indicated by recent groundwater data are discussed below.

Section 5.2 Nature and Extent of COCs and NAPL in Groundwater

Groundwater samples were collected from monitoring wells installed in the four units of the uppermost GWBUs at the Site. Laboratory data packages are provided in Appendix 10. COCs detected in groundwater samples, and their respective assessment levels, are listed on Table 5A. A complete summary of groundwater analytical data for the Site from 2004 through 2009 is presented on the following tables:

Table	Description
5D-1	Summary of Groundwater Sampling Results – A-TZ
5D-2	Summary of Groundwater Sampling Results – Temporary Wells
5D-3	Summary of Groundwater Sampling Results – B-TZ and B-CZ
5D-4	Summary of Groundwater Sampling Results – C-TZ
5D-5	Summary of Groundwater Sampling Results – D-TZ

COCs evaluated for the purpose of the APAR were site-specific COCs identified in the RFI Work Plan (IC, 1994) prepared for the Site. In addition to the site-specific COCs, groundwater samples from the temporary wells were sampled for a more comprehensive list of constituents (Section 3.1). Comparing the maximum groundwater analytical data from the January/February 2009 groundwater sampling event and temporary well (TW) sampling event in March 2007 to RALs, concentrations of 40 target COCs exceeded their respective RALs or had a SDL greater than the RAL (>SDL):

VOCs

- 1,1,2,2-Tetrachloroethane (>SDL, A-TZ, TW only)
- 1,1,2-Trichloroethane (>SDL, A-TZ, TW only)
- 1,1-Dichloroethene (>SDL, A-TZ, TW only)
- 1,2-Dichloroethane (>SDL, A-TZ, TW only)
- 1,2-Dichloroethene (total) (>SDL, A-TZ, TW only)
- 1,2-Dichloropropane (>SDL, A-TZ, TW only)
- Benzene (A-TZ, B-TZ, C-TZ)
- Bromodichloromethane (>SDL, A-TZ, TW only)
- Bromomethane (>SDL, A-TZ, TW only)
- Carbon Tetrachloride (>SDL, A-TZ, TW only)
- cis-1,3-Dichloropropene (>SDL, A-TZ,

SVOCs

- 2,4-Dimethylphenol (A-TZ only)
- 2-Methylnaphthalene (A-TZ, B-TZ, C-TZ)
- Acenaphthene (C-TZ only)
- Benz(a)anthracene (A-TZ, B-TZ, C-TZ)
- Benzo(a)pyrene (A-TZ, B-TZ, C-TZ)
- Benzo(b)fluoranthene (A-TZ, TW only)
- Benzo(k)fluoranthene (A-TZ, TW only)
- Bis(2-ethylhexyl)phthalate (D-TZ, possible lab contaminant)
- Carbazole (A-TZ, TW only)
- Chrysene (C-TZ only)
- Dibenzo(a,h)anthracene (A-TZ, TW only)

VOCs

TW only)

- Dibromochloromethane (>SDL, A-TZ, TW only)
- Dichloromethane (B-TZ only)
- Ethylbenzene (A-TZ, TW only)
- Methylene Chloride (>SDL)
- Tetrachloroethene (>SDL, A-TZ, TW only)
- Toluene (A-TZ only)
- trans-1,3-Dichloropropene (>SDL, A-TZ, TW only)
- Trichloroethene (>SDL, A-TZ, TW only)
- Vinyl Chloride (>SDL, A-TZ, TW only)
- Xylenes (total) (A-TZ, TW only)

SVOCs

- Dibenzofuran (A-TZ, B-TZ, C-TZ)
- Fluoranthene (C-TZ only)
- Fluorene (C-TZ only)
- Indeno(1,2,3-cd)pyrene (A-TZ, TW only)
- Naphthalene (A-TZ, B-TZ, C-TZ)
- n-Nitrosodi-n-propylamine (A-TZ, TW only)
- Phenanthrene (C-TZ only)
- Pyrene (C-TZ only)

Groundwater flow conditions at the Site have been evaluated based multiple fluid measurements collected since 2004, with the potentiometric surface relatively consistent in the transmissive zones over that time period. Groundwater data collected from the February 2009 gauging event are consistent with data collected previously at the Site. Therefore, potentiometric surface maps from February 2009 for each of the four transmissive zones, A-TZ, B-TZ, C-TZ, and D-TZ, are presented on Figures 5A-1 through and 5A-4, respectively. The NAPL (LNAPL and DNAPL) distribution at the Site is presented on Figure 5A-5. Table 5D provides a summary of the fluid-level measurements since 2004.

The spatial distributions of the COCs exceeding the RALs in each GWBU from the February 2009 monitoring event is presented on Figure 5B-1 for unit A-TZ, on Figure 5B-2 for B-TZ, on Figure 5B-3 for C-TZ, and Figure 5B-4 for D-TZ. Details of the potentiometric surface, occurrence of NAPL, and distribution of the COCs for each transmissive zone are discussed below.

Transmissive Zone A-TZ

Groundwater in the A-TZ generally flows from west to east across the Site at a gradient of approximately 0.006 ft/ft, with groundwater divide on the east side of the Site just west of the Lockwood Road Bridge (Figure 5A-1). West of the bridge is a series of underground utilities (i.e., 60-in wastewater line, and 84-in water line) that run north to south and appear to intersect the A-TZ (see Cross Section A-A', B-B', and C-C', Figure 4C-1). Groundwater flow in the A-TZ flows to the east on the west side of the underground utilities, and flows to the west on the east side of this area. The highest groundwater elevations in the A-

TZ are near SWMU No.1 at 41.25 feet relative to the City of Houston Vertical Datum (HVD) (MW-09) and west of the Site at 43.09 feet HVD (MW-29A), with the lowest elevation of at 32.56 feet HVD (MW-44A).

NAPL

Approximately 1.2 feet of LNAPL has been observed at A-TZ in temporary well TW-02 within the AST Area (SWMU No. 8) (Figure 5A-5), at a depth of approximately 10 feet bgs. A sample of the LNAPL from TW-02 was collected in 2007 and analyzed for hydrocarbon fractions and fluid properties. The hydrocarbon fraction analysis showed that approximately 82.7 percent of the hydrocarbons fell within the C_4-C_{11} range, with less than 10 percent in the C_{11}-C_{15} and C_{15}-C_{28} range (Appendix 11). The specific gravity of LNAPL was 0.82 (at 70 degrees Fahrenheit), and had a viscosity of 0.99 centipoises. This LNAPL likely consists of naphtha or other drying agents that were used in the sap removal process during the wood preserving activities at the Site. LNAPL has not been observed at any other locations at the Site. Three permanent monitoring wells (TW-56A (test well), MW-57A, and MW-58A) were installed in January 2009 to evaluate the lateral extent of LNAPL near TW-02. No LNAPL was observed in these wells in February 2009.

DNAPL is present in A-TZ on the northern edge and off site to the north. Traces of DNAPL are present in monitoring wells MW-33A and MW-17C, and 6.2 feet of DNAPL (in-well thickness) has been observed at MW-32A at a depth approximately 27 feet bgs. A sample of the DNAPL was collected in February 2008 from MW-32A and analyzed for fluid properties. The specific gravity of LNAPL was 1.056 (at 70 degrees Fahrenheit), and had a viscosity of 8.53 centipoises. The in-well DNAPL thickness measured in MW-32A is not representative of the apparent thickness in the formation. The monitoring well was completed approximately 11 feet below the assumed base of the A-TZ. Therefore, the well is acting as a collection sump for DNAPL, and may be collecting DNAPL from the B-CZ (Figure 4C-2). This is supported by the CPT/ROST data for CPT-42R-08 located approximately adjacent to MW-32A (shown on Cross Section F-F', Figure 4C-2). The ROST fluorescence response was observed at approximately 25.5 feet and smaller responses at 26 and 28.5 feet bgs. The DNAPL near MW-32A appears to be delineated to the north based on the ROST response for CPT-36R-08 (Figure 4C-2). Monitoring wells MW-20A, MW-26A, MW-30A, MW-35A, MW-36A, and MW-57A installed in A-TZ show the lateral extent of the DNAPL is sufficiently delineated in this area.

VOCs

During the most recent groundwater monitoring event, benzene concentrations were detected above the RAL of 0.005 mg/L in eight A-TZ wells located predominantly on the eastern portion of the Site (Figure 5B-1), with the maximum concentration detected of 0.69 mg/L at off-site well MW-32A. Naphtha, a common drying agent used in the wood-treating process, consists of lighter fraction carbon chain compounds, including benzene. No other VOC compounds, with the exception of a slight RAL exceedance of toluene at MW-17, were detected at concentrations above the RAL in unit A-TZ.

SVOCs

During the most recent monitoring event, SVOCs were detected above the applicable RALs in nine A-TZ wells located on the eastern portion of the Site and one well located on the western portion of the Site (MW-12A) (Figure 5B-1). The predominant SVOCs detected in the A-TZ include 2-methylnaphthalene, dibenzofuran, and naphthalene. Benzo(a)pyrene and 2-dimethylphenol concentrations were also detected greater than RALs in MW-32A, MW-49A, MW-55A, and MW-57A. The horizontal distribution of SVOCs has been delineated to RALs based on the monitoring points located in all directions around the area with detections of SVOCs less than the RAL or not detected.

For both VOCs and SVOCs, the lateral extent of the Affected Property is based on the benzene concentrations as defined by monitoring wells MW-13 and MW-38A to the west; MW-25A, MW-26A, MW-33A, MW-35A, MW-36A, MW-44A to the north; MW-59A, MW-60A, and MW-51A to the east, and MW-50A and MW-51A to the south.

Transmissive Zone B-TZ

Groundwater in the B-TZ generally flows from west to east across the Site at a gradient of approximately 0.001 ft/ft. There is a piezometric high near the west perimeter of the Site (Figure 5A-2), similar to the A-TZ. Groundwater in the B-TZ appears to flow to the southwest west of the Site, and to the east-northeast across the Site. The highest groundwater elevation in the B-TZ was 41.20 feet HVD (MW-42B), and lowest elevation was 28.54 feet HVD (MW-29B). Four wells were installed in the B-CZ clay unit east of where the B-TZ pinches out (Figure 5A-2): MW-33B, MW-35B, MW-49B, and MW-63B. At each location, groundwater was encountered but the B-CZ behaves as a Class 3 Groundwater-Bearing Unit (GWBU) in those areas east of MW-35B. Therefore, Class 3 groundwater PCLs were developed for the COCs within the B-CZ. Details of the groundwater classification are provided in Section 2.5. Based on the potentiometric elevations within the A-TZ and B-TZ, there appear to be communication between

the two GWBUs on the west side of the Site.

NAPL

DNAPL has been detected in the B-TZ along the western boundary of the Site at MW-12B and MW-41B (Figure 5A-5). The DNAPL present on the west side of the facility had a maximum in-well thickness of 21.02 feet observed at MW-41B in February 2009. The B-TZ is characterized as silty sand approximately 7 feet thick at MW-41B. A DNAPL sample from MW-12B was collected in April 2007 and analyzed for hydrocarbon fractions and fluid properties, and a DNAPL sample from MW-41B was collected in February 2008 and analyzed for fluid properties only. The hydrocarbon fraction analysis showed that the hydrocarbons in MW-12B consisted of approximately 0.1 percent of the C_4-C_{11} range, 21.2 percent of C_{11}-C_{15} range, and 78.8 percent of the C_{15}-C_{28} range, indicating a heavy end hydrocarbon mixture consistent with weathered creosote (Appendix 11). The specific gravities of the DNAPL samples from MW-12B and MW-41B were 1.055 and 1.050, and viscosities of 192 and 44.5 centipoises, respectively, at 70 degrees Fahrenheit. The DNAPL was characterized in the field as a thick, black fluid with a stringy consistency. DNAPL was not detected in monitoring wells MW-38B, MW-39B, MW-40B and MW-P-11, which indicates sufficient horizontal delineation of the DNAPL.

DNAPL was detected in one of the wells completed in the aquitard B-CZ located off site to the north of the Recent Process Area. Approximately 5.6 feet of DNAPL (in-well thickness) was observed at MW-33B in February 2009 (Figure 5A-5). The B-CZ was described in the boring log for MW-33B as a silty clay with "carbonaceous nodules at 33 feet, 35 feet, and 40 feet, a strong odor, and product was visible within the matrix of freshly broken surfaces" (Log of Boring: MW-33B, Appendix 2). The carbonate nodules are within the silty clay matrix. Monitoring well MW-33B was screened from 32 feet to 42 feet bgs across these nodule intervals. The DNAPL appears to be travelling laterally by gravity or hydraulic pressures along these nodule intervals within the B-CZ. Cross Section G-G' (Figure 4C-3) shows the DNAPL in MW-33B, and potential DNAPL in the CPT/ROST borings CPT-43R-08 and CPT-26R-01 within the B-CZ at depths below the A-TZ. The ROST log for CPT-43R-08 shows fluorescence spikes approximately 28 feet and 35 feet bgs within the B-CZ (Appendix 2). In the area of MW-33B, groundwater samples collected from the A-TZ monitoring wells (MW-33A and MW-26A) have shown COC concentrations less than RALs; suggesting that the DNAPL is not travelling horizontally through the A-TZ, but rather through these carbonate nodule intervals. Details of NAPL recoverability and migration within the B-CZ will be discussed in the Response Action Plan (RAP).

VOCs

Benzene was detected above the RAL on the west side of the Site at monitoring well MW-40B at 0.026 mg/L with no detections above the SDL (<0.0005 mg/L) at any B-TZ monitoring points located downgradient from this area (Figure 5B-2). Two CPT Hydropunch reconnaissance groundwater samples from CPT-50R-08 and CPT-51R-08 were collected from the B-TZ north of the Site and a groundwater sample from well MW-39B was collected to evaluate the off-site migration of COCs. Based on these results, benzene concentrations are delineated on-site to the RAL in the B-TZ. No other VOCs were detected in Unit B-TZ monitoring wells at concentrations exceeding the applicable RALs.

As previously discussed, the B-CZ where monitoring wells MW-33B, MW-49B, and MW-63B are completed is an aquitard and does not yield a sufficient quantity of groundwater to be considered a current or future usable water resource. Therefore, Class 3 groundwater PCLs were developed for COCs detected in these wells. On the northeastern portion of the Site within the B-CZ, benzene was detected above the RAL at two locations north of the site, MW-33B ($^{GW}GW_{Class3}$) and MW-35B ($^{GW}GW_{Ing}$) (Figure 5B-2), with a maximum concentration of 2.4 mg/L detected in MW-33B where DNAPL was encountered. Benzene concentrations were detected in MW-63B to the north, and in MW-49B to the southeast at 0.17 mg/L and 0.0095 mg/L, respectively. Based on the groundwater classification and analytical results, the benzene concentrations within the B-CZ are delineated to the applicable RAL.

SVOCs

SVOCs exceeding the applicable RALs were detected at MW-40B on the west side of the Site. The SVOCs detected consisted of 2-methylnaphthalene, benzo(a)pyrene, dibenzofuran, and naphthalene at concentrations exceeding the applicable RALs. SVOCs were not detected above RALs at any of the monitoring wells located downgradient of MW-40B (Figure 5B-2), demonstrating delineation to the RALs in this portion of the B-TZ. Monitoring wells located downgradient of MW-12B and MW-41B, which contain DNAPL, show COCs in groundwater attenuate over a short distance (<100 feet).

On the northeastern portion of the Site, SVOCs were detected in three monitoring wells completed in the B-CZ located north of the Site (MW-33B, MW-35B, and MW-63B) and in one monitoring well east of the Site (MW-49B). Bis(2-ethylhexyl)phthalate, a common laboratory contaminant, was the only SVOC detected at the northernmost well, MW-63B, at a concentration of 0.0088 mg/L, less than the $^{GW}GW_{Class3}$ RAL of 0.6 mg/L. 2-Methylnaphthalene, dibenzofuran, and naphthalene were the only SVOCs detected above the RALs in the B-CZ wells (MW-35B). Using the recent groundwater data, SVOCs are shown to

be delineated within the B-CZ.

Transmissive Zone C-TZ

Groundwater in the C-TZ flows from northeast to southwest across the Site (Figure 5A-3) at a gradient of 0.0009 ft/ft. Groundwater elevations range from approximately 29.28 feet (MW-27C) to 23.60 feet (MW-29C). This flow pattern has been consistent at the Site since 2004.

NAPL

DNAPL is present in the C-TZ extending from the northeast side of the Site at MW-23C to approximately 900 feet off site to the northeast near MW-46C. DNAPL was observed in on-site monitoring well MW-23C, and off-site monitoring wells MW-25C, MW-34C, MW-44C, MW-45C, and MW-46C. Maximum DNAPL in-well thicknesses observed in the C-TZ during the February 2009 sampling event was 10.7 feet at MW-34C and 9.6 feet at MW-45C (Figure 5A-5). The thickness of DNAPL in the wells does not represent actual thicknesses in the GWBU. The monitoring wells generally extend below the lower confining unit and typically have a 0.5-foot to 1-foot sump at the bottom of the well, which allows DNAPL to collect in the bottom of the well.

A sample of the DNAPL from MW-25C was collected in April 2007 and analyzed for hydrocarbon fractions and fluid properties. The hydrocarbon fraction analysis showed that approximately 0.7 percent of the hydrocarbons fell within the C_4-C_{11} range, 42 percent were within the C_{11}-C_{15} range, and 57.3 percent were within the C_{15}-C_{28} range (Appendix 11). The specific gravity of DNAPL was 1.059 (at 70 degrees Fahrenheit), and had a viscosity of 8.72 centipoises. This DNAPL is similar to the DNAPL encountered in the B-TZ on the west side of the Site, with a slightly higher middle fraction (C_{11}-C_{15}) hydrocarbon component compared to MW-12B, and less viscous than the DNAPL in MW-12B.

The groundwater gradient of Unit C-TZ is to the southwest however, DNAPL is not observed southwest of the suspected historic source area indicating DNAPL transport may be influenced by the structure of the confining layer (D-CZ) at the base of the C-TZ and the stratigraphy of sandier material found in the C-TZ. CPT/ROST borings were conducted north and northwest of the DNAPL plume observed in the C-TZ to evaluate the lateral extent of the DNAPL. CPT/ROST locations CPT-44R-08, CPT-45R-08, and CPT-46R-08 (logs provided in Appendix 2) did not show any ROST fluorescence responses in the C-TZ, suggesting no DNAPL present at those locations. Based on the monitoring wells and CPT/ROST borings

completed in the C-TZ, the horizontal extent of the DNAPL has sufficiently been delineated at the Site.

VOCs

Of the VOCs analyzed, benzene concentrations were detected above the RAL in three C-TZ monitoring wells: MW-17C, MW-18C, and MW-23C (0.03 mg/L, 1.4 mg/L, and 0.017 mg/L, respectively) located on the eastern portion of the Site. Benzene was not detected above the RAL in monitoring wells MW-12C, MW-15C, or MW-21C located downgradient of well MW-17C, indicating that benzene is delineated to the RAL downgradient in the C-TZ. Groundwater data from monitoring wells MW-28C, MW-47C, MW-48C, MW-53C, Hydropunch sample CPT-54R-08, and MW-27C collected in the C-TZ confirm the horizontal extent of benzene concentrations to the RAL cross gradient and upgradient. Toluene was detected at one location, MW-18C, at a concentration equal to the RAL (1 mg/L). No other VOCs were detected in the C-TZ monitoring wells at concentrations exceeding the applicable RALs.

SVOCs

SVOCs were detected above RALs in four monitoring wells, MW-17C, MW-18C, MW-23C, and MW-54C located on the eastern portion of the Site. The SVOCs included 2-methylnaphthalene, dibenzofuran, and naphthalene; with numerous SVOCs detected in MW-23C likely a result of DNAPL entrainment collected in the sample. Pentachlorophenol concentrations were detected above the RAL (0.001 mg/L) in MW-18C (0.026 mg/L); however, no other C-TZ monitoring wells had pentachlorophenol detected above the SDL. SVOCs were not detected above RALs at monitoring wells located downgradient of MW-23C, indicating that SVOCs are sufficiently delineated in Unit C-TZ. Dissolved-phase data show relatively limited COC migration beyond the DNAPL.

Transmissive Unit D-TZ

Transmissive Unit D-TZ was evaluated in the vicinity of where DNAPL was detected in the C-TZ to evaluate if COCs and/or DNAPL have migrated to the next GWBU and thus verify the vertical extent of COCs in groundwater has been defined. Groundwater in the D-TZ appears to flow from the southeast to northwest at a gradient of 0.002 ft/ft (Figure 5A-4). The groundwater elevations range from -42.17 feet HVD (MW-65D) to -39.67 feet HVD (MW-66D).

NAPL has not been observed in Unit D-TZ at any monitoring locations; and the site-specific COCs were not observed in the D-TZ groundwater samples from any monitoring locations, except for bis(2-ethylhexyl)phthalate concentrations that were detected in MW-66D at 0.0064 mg/L just above the RAL of

0.006 mg/L. Groundwater COC concentrations in the D-TZ are presented on Figure 5B-4. Bis(2-ethylhexyl)phthalate is a common laboratory contaminant, and the detection in the D-TZ is not likely from the Site as discussed in Section 10.0. Based on these results, COCs at the Site are vertically delineated to the applicable RALs.

Notes:

1). GWGWIng PCL = TRRP Tier 1 Protective Concentration Level for Class 2 groundwater ingestion pathway (30 acre source area).
2). Residential land use assumed to provide most conservative TRRP PCLs.
3). Only COCs having at least one detection and/or a non-detection with a SQL greater than the RAL are included in this table.
4). Concentrations exceeding the PCL have been highlighted.
5). U = not detected above MCL
6). J = Estimated Concentration between the SQL and the Reporting Limit

Notes:
1. Sampling locations shown on Figure 1A
2. Concentrations > RAL are **bold** type.
3. Concentrations > cPCL are highlighted.
4. Non-detected concentrations > RAL or cPCL are **bold** type.
5. TRRP PCLs (30 TAC §350, Tables 1, 2, and 3), last updated March 25, 2009.
6. RAL = Residential Assessment Level, C/I = Commercial/Industrial
7. J = Estimated value, < = Compound not detected at the specified detection limit

Notes:
1. Sampling locations shown on Figure 1A
2. Concentrations > RAL are **bold** type.
3. Concentrations > cPCL are highlighted.
4. Non-detected concentrations > RAL or cPCL are **bold** type.
5. TRRP PCLs (30 TAC §350, Tables 1, 2, and 3), last updated March 25, 2009.
6. RAL = Residential Assessment Level, C/I = Commercial/Industrial
7. J = Estimated value, < = Compound not detected at the specified detection limit

Table 5B-4

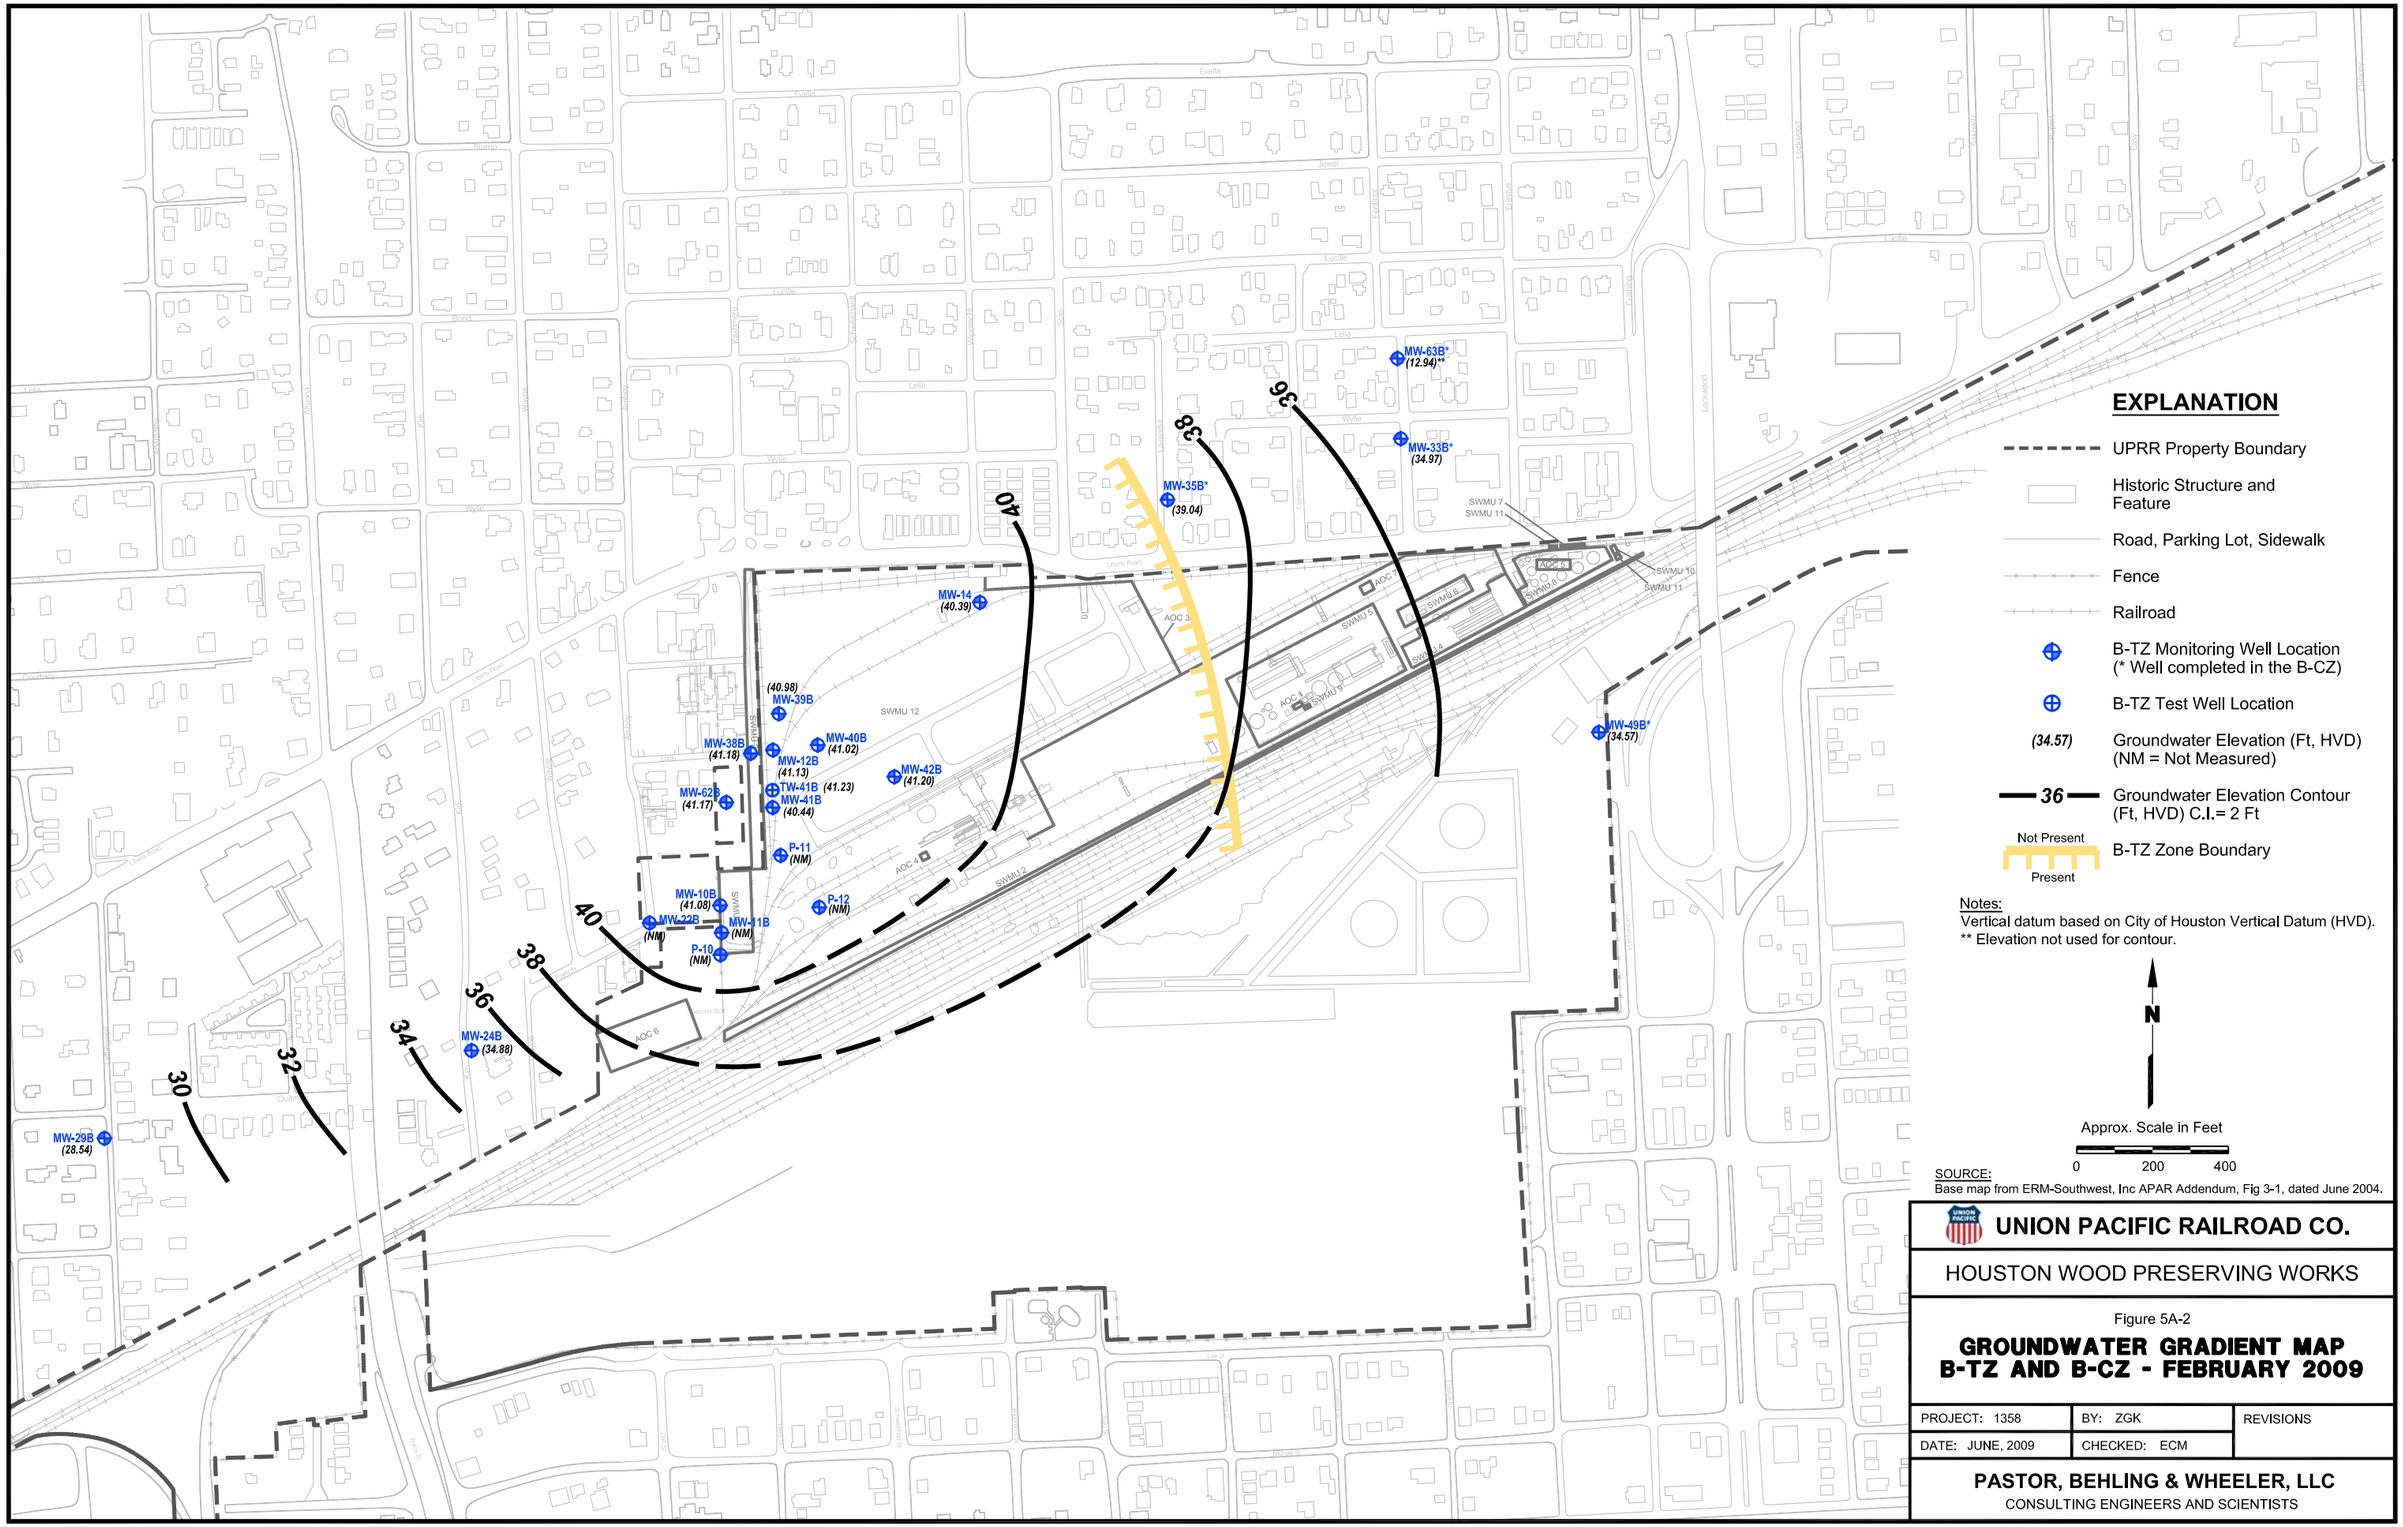
PASTOR, BEHLING & WHEELER, LLC
CONSULTING ENGINEERS AND SCIENTISTS



EXPLANATION

- UPRR Property
- Historic Structure and Feature
- Road, Parking Lot, Sidewalk
- Fence
- Railroad
- A-TZ Monitoring Well Location
- A-TZ Temporary Monitoring Well Location
- General Groundwater Flow Direction
- Affected Property/PCLE Zone

Notes:
All concentrations are in mg/L.
J = Estimated value between SQL and MDL.
U = Not detected (RL/SQL reported).
NA = Not Analyzed.
Bolded and highlighted concentrations exceed Residential Assessment Level (RAL).
DNAPL = Dense non-aqueous phase liquids detected in monitoring well (Feb 09).
LNAPL = Light non-aqueous phase liquids detected in monitoring well (Feb 09).

Residential Assessment Levels

Parameter	RAL (mg/L)	cPCL (mg/L)
1,2-Dichloroethane	0.005	0.005
2,4-Dimethylphenol	0.49	1.5

SECTION 9.0 ECOLOGICAL RISK ASSESSMENT

Based on the original APAR (ERM, 2000) and Revised ARAR (ERM, 2004), the Site passed the TCEQ Tier 1 Ecological Exclusion Criteria Checklist. The justification provided in the Revised APAR for passing the exclusion criteria stated the following:

> *The site is wholly contained within contiguous land that is utilized for industrial activity and is characterized by pavement, active railroads, roadways, equipment storage areas, loading areas for locomotives, or otherwise disturbed ground. Adjacent off-site areas include industrial properties, commercial properties, residential properties, and minor undeveloped tracts. The on-site and off-site areas are highly disturbed. The nearest surface water bodies, SWMU 2 and AOC 6, are intermittent/seasonal storm water conveyance features and past corrective actions have removed the visibly affected material. The environmental setting of the affected property does not facilitate or support the establishment of ecological communities, either on site or off site.*
>
> *The evaluation concludes that the constituents associated with the HWPW property are not an imminent threat to surface waters because the drainage ditches (SWMU 2) and portions of AOC 6 are not considered to be waters of the State and that these areas are not in ultimate contact with surface waters of the State. In addition, these areas do not routinely contain surface water (intermittent - seasonal) and are not likely to be consistently or routinely used as valuable habitats by ecological communities.*
>
> *The HWPW site meets the exclusion criteria for soil and surface water/sediment pathways and, therefore, no further ecological evaluations are considered necessary.*

However, as stated in the TCEQ comment letters on the Revised APAR dated October 8, 2004 and April 15, 2005 (Comment No. 2 and RTC 2, respectfully), the TCEQ requested that the Inactive Wastewater Lagoon (AOC 6) and SDD southwest of AOC 6 be further investigated to assess if a Tier 2/3 Ecological Risk Assessment (ERA) was necessary to evaluate protectiveness for ecological receptors. Instead of conducting a Tier 2 Ecological ERA, an Expedited Stream Evaluation (ESE) was conducted on the man-man ditch southwest of AOC 6. A discussion of the ESE to address the drainage ditch and an evaluation of the Inactive Waste Water Lagoon (AOC 6) are provided in the following sections.

Section 9.1 Expedited Stream Evaluation

As stated in the previous Tier 1 Ecological Exclusion Criteria Checklists, the man-made drainage ditch is not considered a viable habitat to sustain ecological communities. To further support this observation, an ESE was conducted for the drainage ditch. Below is an evaluation of the site relative to the ESE criteria as detailed in the TCEQ Guidance for Conducting Ecological Risk Assessments at Remediation Site in Texas (RG-262 (revised)), December 2001) (TCEQ, 2001). These conditions are itemized below together with site information that provides the rationale for meeting the conditions. Photographs of the drainage ditch are provided in Attachment 13.

- **The stream is intermittent (dries up completely at least one week a year) without perennial pools.**

The sole purpose of the ditch is to serve as flood control by conveying storm water from the rail area and from the residential areas southwest of the Site. There are no underground storm water lines immediately southwest of the Site, nor in the residential areas southwest of the Site. Base flow for this drainage ditch is non-existent as no evidence is reported that suggests otherwise. During storm events, the ditch receives storm water flow from the railroad and from the adjacent residential properties (Figure 9A). A May 2009 site visit conducted by PBW found the ditch was dry with areas of standing water at a portion of the ditch approximately 10 feet long and 3 feet wide, as shown on the Site photographs (Appendix 13). The area where water was noted coincides in the general area where the excavation activities were conducted in 1995 and 1997 (see Section 1.2 for details). The standing water is likely a result of areas within the ditch that were not fully backfilled following the excavation activities, or where there is a topographic low within the drainage ditch.

Based on this conclusion, the ditch meets the definition of intermittent without perennial pools as defined at §307.3 (a), as amended and discussed in the Implementation Procedures (TNRCC, 2000), as amended).

- **The stream is located in a disturbed area (generally, such situations occur in predominantly urban or commercial/industrial settings).**

The drainage ditch is located in a disturbed area. Land use in the vicinity of the Site and along the drainage ditch is developed as commercial/industrial with residential properties north of the ditch west of the Site (Figure 9A and 9B). The UPRR rail line, which through its construction created the drainage ditch, parallels the drainage ditch south of the ditch. In the vicinity and west of Waco Street, storm water from the residential properties flows into the drainage ditch (Figure 9B). Oil and grease (other sources of PAHs) from vehicles parked and abandoned in the residential areas likely run off into the drainage ditch (USGS, 2007).

- **The stream meets the acute water quality criteria specified in Table 1 of 30 TAC §307.6 or appropriate surrogate values if there is no criteria specified.**

No surface water samples were collected for this assessment. Since the drainage ditch receives storm water from urban run off and especially from paved areas (i.e. city streets), it is likely that PAH compounds from storm water run off have entered the ditch. Based on a USGS study on the effects of coal-tar sealed parking lots, average concentration in PAH particles washed off parking lots that were not seal-coated was 54 mg/kg, with seal-coated lots having much higher PAH concentrations (USGS, 2007). Therefore, with the ditch receiving storm water run off from residential streets made with asphalt, PAHs from anthropogenic sources likely enter the drainage ditch and any surface water sampling would be influenced from these other sources.

- **There is a lack of appreciable instream, edge, or riparian habitat, forage, or shelter in or along the watercourse.**

The ditch is best characterized as a storm water drainage ditch with no appreciable instream habitat available. The ditch is bounded to the south by rail lines, and to the north by a chainlink fence within the Site (Appendix 13). There is a segment of the adjacent property north of the ditch, including AOC 6, that contains wooded areas, but these areas only extend to Kirk Street (Figure 9A). The width of this vegetative band, flanked on both sides by industrial and urban activities does not constitute viable habitat for ecological communities. The presence of the numerous residential developments, roads, and the railroad line does not provide for appreciable amounts of forage or shelter areas along the ditch.

- **The watercourse or surrounding vicinity is not known to serve as habitat, foraging area, or refuge to threatened/endangered or otherwise protected species.**

Because of the limited size of the vegetated area and the industrial and urban setting surrounding this area, the ditch and its surrounding areas do not serve as viable habitat, forage area or refuge for threatened and endangered (T&E) species.

- **The area is not consistently or routinely used as valuable habitat for natural communities including birds, mammals, reptiles, etc.**

As noted above, the ditch is banked by localized patches of heavy vegetation; however, this vegetation corridor is narrow due to adjacent rail lines, urban roads, and residential properties. This "patchy" vegetation within the urban environment along a drainage ditch is not considered to provide viable habitat capable of sustaining natural communities.

- **There are no impacts immediately evident in downstream areas where habitat is more likely to support wildlife.**

The drainage ditch likely discharges storm water to Buffalo Bayou, which would be considered the downstream area where habitat is likely to support wildlife, approximately 8,500 feet from the Site. The drainage ditch receives storm water run off from numerous urban areas between the Site and the likely discharge point into Buffalo Bayou. Since the COCs detected in surface soils with the drainage ditch were delineated to TRRP RALs immediately west of Waco Street (SB-112, SB-113, and SB-114, (Figure 9A), impacts from the Site do not likely impact the downstream habitat.

Section 9.2 Reasoned Justification

The Inactive Wastewater Lagoon (AOC 6) received sap water discharge from the Recent Process Area that flowed via the wood-lined SDD (SWMU No. 2) prior to 1974 (PRC, 1993). The lagoon was a low-lying area that allowed collection of discharged sap water and storm water. In May 1979, the material in the lagoon caught fire and was extinguished by the Houston Fire Department (TDWR IOM, 1979b). In response, SPTC excavated a trench across the lot to collect the liquids impounded on the property and

excavated the surface soils in the area (TDWR IOM, 1979b) (approximate area of excavation shown on Figure 1A-3). Soils excavated from this area were placed in the Closed Surface Impoundment (SWMU No. 1) in 1979. The SDD (SWMU No. 2) was plugged to prevent further discharge into the area (PRC, 1993). There is little information on how the area was backfilled. Currently, the Inactive Wastewater Lagoon (AOC 6) is undeveloped and is characterized by medium and large-growth trees and some vegetation.

From 2006 through 2009, a total of 24 shallow soil borings (SB-79 through SB-84, and SB-100 through SB-117) were drilled and sampled within the southwest drainage ditch and the Inactive Wastewater Lagoon (Figure 9A). Soil samples were generally collected from 0 to 0.5 feet, and from 1 to 2 feet bgs and analyzed for site-specific COCs.

Soil analytical results were compared to TRRP RALs to identify the Affected Property, as discussed in Section 4.0. The primary COCs that exceeded RALs in these samples were PAHs benz(a)anthracene, benzo(a)pyrene, and fluoranthene, which are summarized on Table 9A for the soil samples collected in this area. Only two non-PAH COCs were detected above RALs, which consisted of dibenzofuran and 1,2-diphenylhydrazine, both detected in SB-104(1-2). For benz(a)anthracene and benzo(a)pyrene, concentrations detected in SB-79(1.5-2), SB-82(1.5-2), SB-84(0-0.5) and SB-84(1.5-2), SB-104(1-2), SB-106(0-0.5), SB-107(1-2), SB-108(0-2), and SB-110(0-0.5)/SB-110(0.5-2) exceeded critical PCLs and will require a response action in accordance with TRRP.

These soil data were also compared to ecological soil screening levels (Eco-SSLs) developed by the EPA Office of Solid Waste and Emergency Response (OSWER) (EPA, 2007). The Eco-SSLs developed by the EPA are used to evaluate contaminants of potential concern (COPCs) and are not designed to be used as cleanup levels. Therefore, the Eco-SSLs were used to compare to TRRP PCLs for evaluating if a response action addressing human health risk would eliminate a potential ecological pathway through the reasoned justification clause (30 TAC §350.77).

The Eco-SSLs were developed based on the two categories of PAHs:

- low molecular weight (LMW) PAHs that include 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, fluorine, naphthalene, and phenanthrene; and
- high molecular weight (HMW) PAHs that include benzo(a)anthracene, benzo(a)pyrene, chrysene, dibenzo(a,h)anthracene, fluoranthene, pyrene.

With no appreciable habitat noted along the drainage ditch and the narrow band of vegetation not likely to sustain a viable ecological community as discussed in Section 9.1, soil invertebrates were the only potential ecological pathway evaluated. The EPA Eco-SSLs for soil invertebrates are 29 mg/Kg for LMW PAHs and 18 mg/Kg HMW PAHs (EPA, 2007).

Most of the surface soil data collected at AOC 6 and the drainage ditch include the PAHs listed above except for dibenzo(a,h)anthracene, which is not considered a site-specific COC. However, to compare the HMW PAHs detected in the soil samples to the Eco-SSLs, a dibenzo(a,h)anthracene concentration was conservatively assumed to be equal to the benzo(a)pyrene concentration detected in each sample for calculating the HMW PAH value. The calculated LMW and HMW PAHs values are provided on Table 9A. LMW and HMW PAH values that exceed the Eco-SSLs include SB-84(0-0.5) SB-104(1-2), SB-106(0-0.5), and SB-108(0-2). For each of these samples, the individual PAHs exceeded the human health cPCLs, and thereby will require a response action.

To address the human health PCLE zone for surface soils in this area, the proposed response action will likely be soil removal or an engineered cap, which will be detailed in the RAP. Through this action, the proposed remediation to address human health risk will coincidentally address ecological risk by eliminating the ecological exposure pathways. Therefore, to address the PCLE zone for surface soils in the drainage ditch and AOC 6, no additional ecological risk evaluation will be necessary under the reasoned justification clause (30 TAC §350.77).

SECTION 10.0 COC SCREENING

COC screening of the sampled media collected prior to 2004 was detailed in the Revised APAR (Appendix F) (ERM, 2004). The COC list for the Site consists of 34 site-specific COCs established in the RFI Work Plan (IC, 1994). However, in response to the presence of LNAPL in the A-TZ (TW-02) in 2007, UPRR analyzed selected soil and groundwater samples from source areas for a comprehensive list of constituents by EPA Methods 8260 for VOCs and 8270 for SVOCs.

For the purposes of screening COCs, the 34 site-specific COCs were retained for PCL development, and are listed in Table 10A A total of 44 additional potential COCs (30 VOCs and 14 SVOCs) were evaluated in soil and groundwater samples collected in 2007 near former source areas (i.e., TW-01, TW-02, MW-52A). As shown on Table 10A, 15 of the VOCs and 9 of the SVOCs were screened from further PCL development because the COC was not detected or was detected in at least one sample and the detected concentrations and reporting limits or SDLs was less than the RAL for that COC in the medium and all other sampled media. Fourteen COCs, all VOCs, had elevated SDLs above the applicable PCLs but not detected above the SDL in the groundwater sample collected from TW-02, which had LNAPL present in the well. These COCs are highlighted on Table 10A. For these potential COCs, groundwater samples from monitoring wells near TW-02 will be sampled for these COCs to ensure they are not present in the A-TZ groundwater at concentrations that exceed TRRP PCLs. A discussion of COCs screened from further PCL evaluation is provided in the following sections.

Section 10.1 Frequency of Detection

No COCs were removed from PCL evaluation based on the frequency of detection.

Section 10.2 Lab Contaminant or Blank Contaminant

Of the site-specific COCs evaluated, bis(2-ethylhexyl)phthalate concentrations detected at the Site are not a result of current or historical industrial activities conducted at the Site, but rather a result of sampling bias or lab contaminant. Bis(2-ethylhexyl)phthalate is the most commonly used of a group of related chemicals called phthalates or phthalic acid esters (EPA, 2006). This chemical is used as a plasticizer for polyvinylchloride (PVC) and other polymers including rubber, cellulose and styrene. Bis(2-

ethylhexyl)phthalate is also a common laboratory contaminant as detailed in 30 TAC§350.71(k)(2)(B) and TCEQ TRRP-14 Guidance Document.

When released to soil, bis(2-ethylhexyl)phthalate will neither evaporate nor leach into groundwater. It has a strong tendency to adsorb to soil and sediments, with calculated log Koc listed in the TCEQ TRRP chemical properties table of 5.8. Experimental evidence demonstrates strong partitioning to clays and sediments. (EPA Web Site, http://www.epa.gov/safewater/dwh/t-soc/dehp.html, 2006). Of the 210 soil samples analyzed for bis(2-ethylhexyl)phthalate from the Site, 34 samples had detectable concentrations of bis(2-ethylhexyl)phthalate (16 percent), with the highest concentration at SB-104(0-0.5) at 0.888 mg/Kg. The TRRP Tier 2 soil to groundwater leaching $^{GW}Soil_{Ing}$ PCL for bis(2-ethylhexly)phthalate is 1,226 mg/kg, over 1,000 times higher than the highest concentration detected on the Site.

Bis(2-ethylhexyl)phthalate was detected above the $^{GW}GW_{Ing}$ PCL in one groundwater sample from D-TZ (MW-66D)) at 0.0064 mg/L above the RAL (0.006 mg/L). Bis(2-ethylhexl)phthalate concentrations were detected in the shallower GWBUs, but none of the samples from the wells in the source area had concentrations above the PCL.

Since concentrations detected in soils on Site were well below the PCL for potential leaching from soil to groundwater, bis(2-ethylhexyl)phthalate preferably adsorbs to soil rather than leaching to groundwater, no concentrations were detected above the groundwater PCL in the A-TZ near the source area, and that bis(2-ethylhexyl)phthalate is a common laboratory contaminant or sampling contaminant (from well materials or sample tubing), the weight-of-evidence suggest that this COC is not related to the Site.

Section 10.3 COC Not Sourced On-Site

No COCs were screened from further PCL development as a result of COCs not sourced on-site.

Section 10.4 Appropriate Sample Quantitation Limits

The reporting limits, or SDLs, for the COCs that were screened from further PCL evaluation were evaluated to ensure the SDL for non-detected COCs were less than the RAL or critical PCL. Of the target COCs listed on Table 10A, the SDLs were less than the applicable RAL except where noted. Fourteen COCs (that are not site-specific COCs) had elevated SDLs as a result of dilution from the groundwater sample collected from TW-02, which had LNAPL in the piezometer. These COCs included 1,1,2,2-

tetrachloroethane, 1,1,2-trichloroethane, 1,1-dichloroethene, 1,2-dichloroethene, 1,2-dichloropropane, bromodichloromethane, bromomethane, carbon tetrachloride, cis-1,3-dichloropropane, dibromochloromethane, dichloromethane, tetrachloroethene, trans-1,3-dichloropropane, trichloroethene, and vinyl chloride (Table 10A). Groundwater samples will be collected from monitoring wells in the vicinity of SWMU No. 8 (i.e., MW-57A, MW-58A, TW-56A) and analyzed for these COCs to confirm if the COCs are present at concentrations greater than PCLs.

Bis(2-chloroethyl)ether was analyzed in four soil samples (TW-01(10-12), TW-02(10-12), and TW-03(2-5) TW-03(11-15)), with no detections above the SDLs. However, two of the samples (TW-03(2-5) and TW(11-15)) had elevated SDLs above the RAL because of sample dilution. Since bis(2-chloroethyl)ether concentrations were not detected in the other two samples, which were collected in the Original and Recent Process Areas (SWMU No. 5 and 4), the appropriate SDL was used for this potential COC and this COC is screened from further evaluation.

Section 10.5 Screened COCs Expected to be Present Dropped from Future Sampling

At this time, no screened COCs that are expected to be present at the Site will be removed from the COC list for future sampling activities.

SECTION 11.0 SOIL CRITICAL PCL DEVELOPMENT

The current land use of the Site is commercial/industrial, and will likely remain commercial/industrial land use for the foreseeable future. The off-site adjacent properties consist of residential and commercial/industrial. Therefore, the critical PCL evaluation was conducted using the TCEQ Commercial/Industrial PCLs for both soil and groundwater pathways on site and Residential PCLs for pathways off site. Below is a discussion of the soil critical PCL development.

Section 11.1 Tier 2 or 3 PCL Development and Non-Default Parameters

Tier 2 and 3 Development

Tier 2 ^{GW}Soil PCLs were calculated for COCs in soils in accordance with the Soil-to-Groundwater PCL equations presented in Figure 30 TAC §350.75(b)(1). Tier 2 PCL equations consider the soil leachate to groundwater as the exposure pathway, surface and subsurface soils as the source medium, and groundwater as the exposure medium. Site-specific data (i.e., total fraction organic carbon (foc), bulk density, volumetric water content, volumetric air content, and pH) were collected from soil boring SB-14(5) as discussed in the Revised APAR (ERM, 2004) to evaluate the site-specific soil attenuation model and develop Tier 2 PCLs. The Revised APAR included Tier 2 calculations; however, the site-specific data used for the calculations (i.e. fraction organic carbon) included soil samples collected below the GWBUs. The Tier 2 calculations in this APAR Addendum uses only site-specific data collected from the unsaturated zone rather than data collected from or below the saturated zone.

The thickness of affected soil (L1) and depth from top of affected soil to groundwater (L2) were conservatively assumed to be the same value given the depth of the COCs that exceeded PCLs were detected in some soil samples near the top of the saturated zone. Non-default parameters, default parameters, and Tier 2 PCL calculations are provided in Appendix 9.

Section 11.2 Soil PCL Adjustments

Soil PCL adjustments in accordance with 30 TAC §350.71(k) were evaluated in the Revised APAR (ERM, 2004). Based on that evaluation, no Soil PCL adjustments were necessary for the COCs identified.

Section 11.3 Soil Critical PCLs

The soil critical PCLs were established for the Site by using the lower commercial/industrial PCLs for on-site soils and residential PCLs for off-site soils for the following pathways:

- $^{Tot}Soil_{Comb}$;
- $^{Air}Soil_{Inh\text{-}V}$ (Tier 1 or 2); and
- $^{GW}Soil_{Ing}$ (Tier 1 or 2).

Comparing the maximum surface and subsurface soil analytical data to the critical commercial/industrial PCLs for on-site and residential PCLs for off-site, concentrations of the following COCs exceeded their respective critical PCLs (with the figure showing the distribution of the COC):

On-Site

Surface Soils
- 1,2-Diphenylhydrazine (Figure 4A-1)
- 2,4-Dinitrotoluene (Figure 4A-2)
- 2-Methylnaphthalene (Figure 4A-3)
- Benzene (Figure 4A-4)
- Benzo(a)anthracene (Figure 4A-5)
- Benzo(a)pyrene (Figure 4A-6)
- Dibenzofuran (Figure 4A-7)
- Naphthalene (Figure 4A-9)
- Pentachlorophenol (Figure 4A-10)

Subsurface Soils
- 2-Methylnaphthalene (Figure 4B-2)
- Benzene (Figure 4B-3)
- Naphthalene (Figure 4B-6)
- Pentachlorophenol (Figure 4B-7)

Off-Site

Surface Soils
- Benzo(a)anthracene (Figure 4A-5)
- Benzo(a)pyrene (Figure 4A-6)

Subsurface Soils
- None

Tables 11A-1 and 11A-2 summarize the critical PCL evaluation for surface soils on-site and off-site, respectfully, and Tables 11B-1 and 11B-2 summarize the critical PCL evaluation for subsurface soils on-site and off-site, respectfully. Figures 11A and 11B presents the spatial distribution of the PCLE zone for surface and subsurface soils, respectively. Soil cross sections were prepared showing the PCLE zones (Figures 11C-1 and 11C-2). Figures showing the individual COC PCLE Zones are indicated next to each COC listed above.

The surface soil PCLE zone extends across the Original Process Area (SWMU No. 5) and Recent Process Area (SWMU No. 4), down the SDD (SWMU No. 2), and across the Former Inactive Wastewater Lagoon (AOC No. 6) (Figure 11A). The PCLE zone includes the COCs listed above, with benzo(a)anthracene (Figure 4A-5), benzo(a)pyrene (Figure 4A-6), naphthalene (Figure 4A-9), and pentachlorophenol (Figure 4A-10) being the primary COCs defining the surface soil PCLE zone. Additional sampling will be necessary to delineate the surface soil PCLE zone north of the Site near SB-60 and SB-61.

For subsurface soils, the PCLE zones for 2-methylnaphthalene, naphthalene (more mobile COCs in soils), and pentachlorophenol were extrapolated using available subsurface soil data and applying the surface PCLE zone for those two COCs to the subsurface. By using the surface PCLE zone, this assumes the PCLE zone extends from the surface to the top of the uppermost GWBU (i.e. A-TZ). However, for pentachlorophenol, none of the groundwater samples from the 2009 groundwater monitoring event detected pentachlorophenol concentrations above the RAL, suggesting the concentrations in surface and subsurface soils are protective of groundwater.

The subsurface PCLE zone is confined to the area around the Original and Recent Process Areas (Figure 11B). Prior to any potential response action, additional subsurface samples may be collected to refine the PCLE zone at the Site.

SECTION 12.0 GROUNDWATER CRITICAL PCL DEVELOPMENT

The land use is and will likely remain commercial/industrial for the foreseeable future. However, with residential properties around the Site and apparent groundwater impacts above PCLs off-site, the critical PCL evaluation was conducted using the more conservative TCEQ Residential PCLs for groundwater pathways. Response actions, which will be detailed in the RAP, will be designed to address PCLE zones based on land use (i.e., commercial/industrial PCLs for on-site PCLE zone). A discussion of the groundwater critical PCL development is presented below.

Section 12.1 Tier 2 or 3 PCL Development and Non-Default Parameters

No Tier 2 or 3 PCLs were developed for groundwater at this Site, and no non-default affected property parameters were used for the groundwater evaluation of this Site.

Section 12.2 Groundwater PCL Adjustments

Using the January-February 2009 groundwater data and data from the test well TW-02, 21 groundwater COCs that were not screened from further PCL evaluation (detailed in Section 10.0) were detected above RALs. These RAL exceedances included nine noncarcinogenic COCs, six carcinogenic COCs, and six COCs with EPA Maximum Contaminant Levels (MCLs) (Table 12A). In accordance with 30 TAC §350.72(b)(1), COCs with MCLs are excluded from the cumulative evaluation. Therefore, since less than 10 noncarcinogenic and 10 carcinogenic COCs were detected above RALs, no cumulative adjustment is necessary for PCL development for groundwater pathways.

Section 12.3 Groundwater Critical PCLs

Groundwater analytical data were compared to the TCEQ TRRP Residential Groundwater PCLs, dated March 2009, assuming the source area greater than 0.5 acre in size (30-acre source area). Critical PCLs were established as the lesser value between residential $^{GW}GW_{Ing}$ and $^{Air}GW_{Inh\text{-}V}$ PCLs. The January-February 2009 groundwater analytical data and CPT Hydropunch groundwater data collected in August 2008 were

evaluated for establishing the groundwater PCLE zone. These analytical data are the most representative groundwater data for the Site. Of the site-specific COCs analyzed in groundwater, concentrations of 17 target COCs exceeded their respective critical PCLs (cPCLs):

VOCs
- Benzene
- Dichloromethane
- Toluene

SVOCs
- 2,4-Dimethylphenol
- 2-Methylnaphthalene
- Acenaphthene
- Benz(a)anthracene
- Benzo(a)pyrene
- Bis(2-ethylhexyl)phthalate
- Chrysene
- Dibenzofuran
- Fluoranthene
- Fluorene
- Naphthalene
- Pentachlorophenol
- Phenanthrene
- Pyrene

The list of COCs that exceed their respective critical PCLs is provided on Table 12A. None of the COCs exceeding the critical PCLs that were not screened out (Section 10) were detected in D-TZ above the critical PCL, except for bis(2-ethylhexyl)phthalate, which is a common laboratory contaminant. The spatial distribution of the PCLE zones in A-TZ, B-TZ, C-TZ, and D-TZ are presented on Figures 5B-1 through 5B-4, respectively, and cross sections showing the PCLE zones are provided on Figures 4C-1 through 4C-4, respectively. The PCLE zone for each transmissive zone is discussed below.

Transmissive Zone A-TZ

Site-related COCs that exceed cPCLs in the A-TZ are defined by monitoring wells MW-13 and MW-38A to the west; MW-13, MW-35A, MW-26A, MW-33A, MW-36A, MW-44A, and MW-25A to the north (off-site); MW-59A, MW-60A, and MW-61A to the east (off-site); and MW-50A, MW-51A to the south (on site) (Figure 5B-1). The primary COCs in the A-TZ that define the PCLE zone include benzene, PAHs (naphthalene, 2-methylnaphthalene), and dibenzofuran. Other COCs are present within the PCLE zone, but not as prevalent as those listed. The highest COC concentrations are generally near the Original Process Area (SWMU No. 5) and Recent Process Area (SWMU No. 4), as well as the AST Area (SMWNU No. 8), where LNAPL was observed (TW-02).

The PCLE zone extends off site to the north at MW-32A, where DNAPL is present. This well may be completed across the thin fracture zone or carbonate nodule zone within the B-CZ, where MW-33B and MW-35B are completed. Seven additional A-TZ monitoring wells located in the residential area north of the Site show COC concentrations below RALs and cPCLs. The PCLE zone extends downgradient to the Lockwood Street overpass on the east end of the Site. COCs do not appear to extend beyond the City of Houston ROW for Lockwood Street (Figure 5B-1).

There are no RAL exceedances near the SWMU No. 1 in the A-TZ. Downgradient monitoring wells MW-22A, MW-64A, and MW-24AR had COC concentrations less than RALs, indicating that previous contamination observed near SWMU No. 1 has attenuated to levels protective of human health.

Transmissive Zone B-TZ/Cohesive Zone B-CZ

There are two PCLE zones within the B-TZ and B-CZ (Figure 5B-2): 1) one near the west end of the Site within the B-TZ centered around monitoring wells MW-12B, MW-40B, and MW-41B, and defined by MW-14, MW-38B, MW-39B, and P-11; and 2) a PCLE zone within the B-CZ around wells MW-33B (GW_{Class3}) and MW-35B, and defined by hydropunch samples CPT-50R-08, CPT-51R-08, MW-63B (GW_{Class3}), and MW-49B (GW_{Class3}). As discussed in Section 2.5, the B-CZ where monitoring wells MW-33B, MW-49B, and MW-63B are installed was classified as a Class 3 groundwater resource.

The B-TZ PCLE zone appears to be a result of the DNAPL in and around MW-12B and MW-41B. However, dissolved-phase COCs from the DNAPL attenuates within 50 to 100 feet of wells containing DNAPL. As noted in Section 5.2, the DNAPL evaluated from MW-12B contained more heavy carbon fractions (C_{15}-C-$_{28}$) compared to other DNAPL evaluated at the Site. In addition, the viscosity of the DNAPL from MW-12B was 192 centipoises, indicating a relatively thick fluid. These properties likely limit the migration potential for the DNAPL in the area, as supported by the monitoring well data.

The PCLE zone within the B-CZ is based on $^{GW}GW_{Ing}$ PCLs for Class 2 groundwater at MW-35B, and $^{GW}GW_{Class3}$ PCLs for Class 3 groundwater at MW-33B, MW-63, and MW-49B (details discussed in Section 2.5). As shown on Figure 5B-2, the highest concentrations in the B-CZ are centered around off-site monitoring well MW-33B where DNAPL was encountered. COCs detected in these wells are similar to the wells completed in the transmissive zones, with 2-methylnaphthalene, benzene, dibenzofuran, and naphthalene being the main COCs exceeding cPCLs. Concentrations observed in these wells do not exceed

the $^{Air}GW_{Inh-V}$ pathway; therefore, with no users of this zone for groundwater, there is no complete pathway to this PCLE zone.

Transmissive Zone C-TZ

The C-TZ PCLE zone extends off-site to the northeast from MW-54C to the southwest on site at MW-17C; and is defined by wells MW-27C upgradient, MW-28C, MW-53C and CPT-54R-08 to the north, MW-19C, MW-47C and MW-48C to the south, and MW-15C and MW-21C downgradient to the southwest (Figure 5B-3). The highest COC concentrations detected in the C-TZ are at MW-18C and MW-21C, where along with MW-25C, MW-34C, MW-44C, MW-45C, and MW-46C (off-site wells), DNAPL was present during the February 2009 sampling event.

Transmissive Zone D-TZ

The only COC that exceeded a cPCL in the D-TZ was bis(2-ethylhexyl)phthalate at a concentrations of 0.0064 mg/L (cPCL is 0.006 mg/L). As discussed in Section 10.0, bis(2-ethylhexyl)phthalate is a common laboratory contaminant, and has a high absorption coefficient. It is highly unlikely that the concentration detected in MW-66D is a result of groundwater migration, but rather a false positive from a sampling or laboratory bias.
