### A Case Study In Environmental Justice:

Toxics Release Inventory Facilities and Fence-line Communities in the Environmental Protection Agency's Region 10

LEIGH MANTE Columbia University School of International and Public Affairs Master of International Affairs Student

### Disclaimer

The findings and views expressed herein are those of the presenter, and do not necessarily represent those of the United States Environmental Protection Agency (US EPA).

Mention of any chemical, product or commercial enterprise does not constitute an endorsement by the United States Environmental Protection Agency.

# **Background and Project Overview**

- Overview: Develop a comprehensive process to rapidly and accurately identify Toxics Release Inventory (TRI) facilities that may be impacting vulnerable and disadvantaged communities
  - Proof of Concept: Focus on U.S. Environmental Protection Agency Region 10 (R10)
- Outcome: Support research and tool enhancement to more readily assess impacts of TRI facilities on fence-line communities, serving as possible prioritization for follow-up, pollution prevention assistance, or other consideration

> Project aligns with President Biden's Environmental Justice (EJ) initiatives:

- Executive Order 12898 on Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations
- Executive Order 13985 on Advancing Racial Equity and Support for Underserved Communities Through the Federal Government

## Data Construct Methodology

### Focus on Emissions of TRI Chemicals to Air

- Risk-Screening Environmental Indicators (RSEI) Modeled Hazard Stack Air Releases
- RSEI Modeled Hazard Fugitive Air Releases

#### Applies two demographic index scores

#### • Demographic Index:

The Demographic Index in Environmental Justice Screening and Mapping Tool (EJSCREEN) is a combination of percent low-income and percent minority, the two demographic factors that were explicitly named in Executive Order 12898 on Environmental Justice. For each Census block group, these two numbers are simply averaged together. The formula is as follows: Demographic Index = (% people of color + % low-income) / 2. Source: The Census Bureau's American Community Survey 5-year summary estimates.

#### • Socioeconomic Indicator Score:

An Average of 4 Percentiles

| Demographic Indicator           | Description   | (Source: 2008-20012 ACS Estimates)      |
|---------------------------------|---|---|
| Low-Income                      | % of block group population at or be                                  | elow twice the federal "poverty level." |
| Minority                        | All people other than non-Hispanic                                    | white-alone individuals.                |
| Less than high school education | % of people age 25 or older without                                   | t a high school diploma.                |
| Linguistic isolation            | % of people in household in which a<br>English less than "very well." | all members over age 14 years speak     |

## Data Construct Methodology Attributes

#### Data Attributes

- > Includes facilities that reported to TRI for reporting year 2019
- Excludes mining facilities to focus on facilities closer to communities and potentially most impacting ambient air
- > Age variables removed from calculation of "Socioeconomic Indicator Score"
- Additional demographic information (grocery stores, medical facilities, schools) pulled from ArcGIS Open Street Maps

### Filtering Options

User has ability to filter by State; City, State; Metropolitan Statistical Area; Top 1%, 5%, 10%, and 25% Socioeconomic Indicator Score; and RSEI Modeled Hazard Stack and Fugitive Air Emission Totals

### Region 10 Non-Mining TRI Facilities with a Socioeconomic Indicator Score Above 0.95, a Total RSEI Modeled Hazard Value 1 Million, and 3-Mile Buffer

Demographic Information by Census Block Group for TRI Facilities in R10 with RSEI Modeled Hazard Totals > 1 Million & Socioeconomic Indicator Scores Above 0.95

| TRI Facility Name                          | City, State  | Industry                      | %<br>People<br>of Color | % of Pop in<br>Low<br>Income<br>Households | % of<br>Population<br>with < HS<br>Education | %<br>Households<br>with<br>Linguistic<br>Isolation | Demographic<br>Index | Socioeconomic<br>Indicator Score | RSEI Modeled Hazard<br>Total (Stack, Fugitive) |

# Making TRI Data Findings Actionable

#### Next steps

- > Use data construct methodology to compare with National Emissions Inventory data
- Share research outcomes with Region 10 program offices

### > Opportunities for Further Study

- > Examine facility-level activity (emissions, processes, pollution prevention activities)
- > Identify potential challenges in engaging in source reduction activities
- > Determine best mode of engagement between EPA and TRI facilities
- Assess surrounding community
  - Study cumulative impact, ambient air monitoring equipment
  - Characterize infrastructure that may be frequently visited
    - E.g.: schools, retail stores, medical facilities

## Major Takeaways

>Analysis identified **eight** TRI facilities in Region 10 for potential follow-up:

- Five facilities fall within EPA's Pollution Prevention National Emphasis Areas (NEA), e.g.:
  - Blue Origin; Boeing Company (Co) of Portland, NEA #4: Aerospace Product and Parts Manufacturing
  - Protective Coating, Incorporated; Hytek Finishes Co; and Rexam Beverage Can Co, NEA #5: Metal Manufacturing and Fabrication
- > Analysis has the potential to inform other EPA efforts
- > Serves as a possible model for automation and report development
