

WOODLAND GARDENS WITH PERMEABLE PAVER COMMUNAL SPACES CONNECT TO DEXTER FIELD, PROVIDING NEIGHBORHOOD RESOURCE

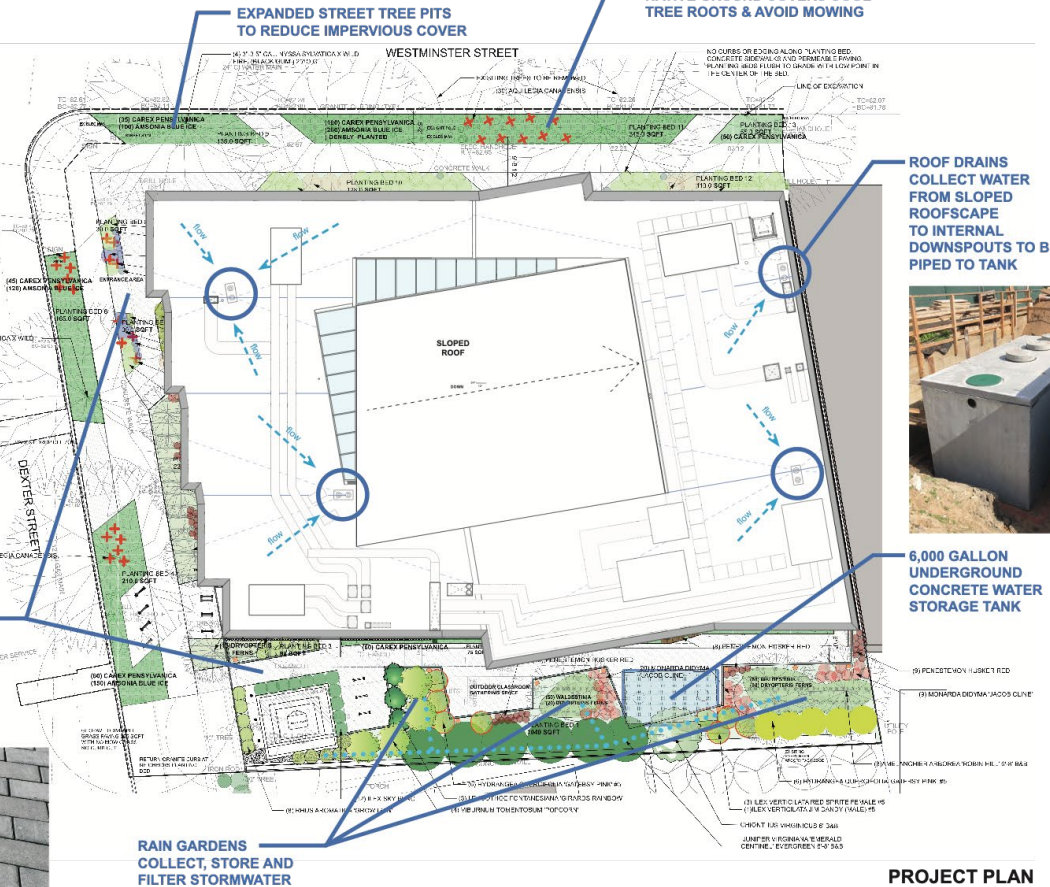

BUILDING CLIMATE RESILIENCE: SITE DESIGN APPROACH FOR WATERSHED, SOILS & ECOLOGY

Strategies to restore ecology of the site, connect green areas and people & build water storage capacity

- 1 Collect clean roof runoff into a 6,000 gal. underground storage tank to reuse for irrigation
- 2 Permeable pavers and expanded tree pits allow stormwater to infiltrate & recharge the watershed
- 3 Rain gardens using bioretention soils capture & slow stormwater run off while creating habitats and restoring the ecology of the site
- 4 Sand based structural soils per soils scientist provide expanded space for tree roots under pavement, extending new street tree life
- 5 Shade trees in city right-of-way provide relief from the heat island effect in the neighboring community
- 6 Sidewalks and gathering spaces allow access to nature in an underserved community

NATIVE GROUND COVERS COOL TREE ROOTS & AVOID MOWING

ROOF DRAINS COLLECT WATER FROM SLOPED ROOFSCAPE TO INTERNAL DOWNSPOUTS TO BE PIPED TO TANK

6,000 GALLON UNDERGROUND CONCRETE WATER STORAGE TANK

SOUTH CORNER OF LANDSCAPE ON DEXTER STREET

PERMEABLE PAVERS RECHARGE THE WATER TABLE

RAIN GARDENS COLLECT, STORE AND FILTER STORMWATER
